## **Smoking And The Lung:**

**Smoking and the Lung** G. Cumming, G. Bonsignore, 2012-12-06      *Smoking and Lung Cancer* Evelyn N. Powers, 2009  
Smoking responsible for 90% of cancer deaths Incidence of lung cancer is rising Lung cancer is responsible for more cancer deaths than colorectal cancer breast cancer and prostate cancer combined Lung cancer primarily strikes people over age 45 By the time that an individual develops symptoms spread has usually occurred Lung cancer is directly related to smoking Over 40 carcinogens have been identified in cigarette smoke The risk of developing lung cancer is directly related to the number of cigarettes smoked The change in consumption from unfiltered high tar cigarettes to filtered low tar cigarettes parallels the change in incidence from squamous cell carcinoma to adenocarcinoma There is a long interval between quitting smoking and elimination of lung cancer risk Up to 40% of newly diagnosed lung cancer occurs in former smokers median abstinence duration 9 years This book presents the latest research in the field from around the world      *The Health Consequences of Smoking* United States. Office on Smoking and Health, 1984      **Cigarette Smoking and Lung Obstruction Among Adults Aged 40-79** Ryne Paulose-Ram, 2015      The Health Consequences of Smoking, 1984  
*Smoking, Lung Cancer and You* Robert Nigel Charles McCurdy, 1958      *The Health Consequences of Smoking*, 1985  
Environmental Tobacco Smoke in the Workplace, 1991      Chronic Lung Disease in Asia Anthony Rebuck, 2014-02 There is a triple threat in the Asian air to human health and well being First we are going to see an increase in tobacco attributable deaths as more and more people smoke Much of this mortality as well as crippling chronic lung disease can be prevented if smokers stop smoking Secondly additional suffering disability and premature death from lung disease can be prevented if pollution Asian pollution being the worst in the world can be reduced And lastly the coughing wheezing and attacks of bronchitis caused by the uniquely Asian problem of the haze would be eliminated if the illegal practice of slash burn is prohibited      Tobacco Smoke and Involuntary Smoking IARC Working Group on the Evaluation of Carcinogenic Risks to Humans, World Health Organization, International Agency for Research on Cancer, 2004 The IARC Monographs series publishes authoritative independent assessments by international experts of the carcinogenic risks posed to humans by a variety of agents mixtures and exposures They are a resource of information for both researchers and national and international authorities This volume is particularly significant because tobacco smoke not only causes more deaths from cancer than any other known agent it also causes more deaths from vascular and respiratory diseases This volume contains all the relevant information on both direct and passive smoking It is organised by first looking at the nature of agent before collecting the evidence of cancer in humans This is followed by carcinogenicity studies on animals and then any other data relevant to an evaluation      Chronic Obstructive Lung Disease, 1984      **Respiratory Health Effects of Passive Smoking** U.s. Environmental Protection Agency, Office of Health and Environmental Assessment, Office of Development, 2014-05-22 An estimated 434 000 deaths per year in the U S or more than one of every six deaths are attributable to tobacco use in

particular cigarette smoking CDC 1991a figures for 1988 Approximately 112 000 of these smoking related deaths are from lung cancer accounting for an estimated 87% of U S lung cancer mortality Cigarette smoking is also causally related to cancer at various other sites such as the bladder renal pelvis pancreas and upper respiratory and digestive tracts Roughly 30 000 deaths per year from cancers at these sites are attributable to smoking Furthermore smoking is the major cause of chronic obstructive pulmonary disease COPD which includes emphysema and is thought to be responsible for approximately 61 000 COPD deaths yearly or about 82% of COPD deaths Tobacco use is also a major risk factor for cardiovascular diseases the leading cause of death in the U S It is estimated that each year 156 000 heart disease deaths and 26 000 deaths from stroke are attributable to smoking In addition to this substantial mortality the association of smoking with these conditions also involves significant morbidity Smoking also is a risk factor for various respiratory infections such as influenza bronchitis and pneumonia An estimated 20 000 influenza and pneumonia deaths per year are attributable to smoking Smokers also suffer from lung function impairment and numerous other respiratory symptoms such as cough phlegm production wheezing and shortness of breath In addition smokers are at increased risk for a variety of other conditions including pregnancy complications and ulcers Although the exact mechanisms and tobacco smoke components associated with these health effects are not known with certainty more than 40 known or suspected human carcinogens have been identified in tobacco smoke Many other toxic agents such as carbon monoxide nitrogen oxides ammonia and hydrogen cyanide are also found in tobacco smoke Smokers however are not the only ones at risk from exposure to these tobacco smoke toxicants In utero exposure from maternal smoking during pregnancy is known to be associated with low birth weight and increased risk of fetal and infant death Furthermore nonsmokers might be at risk for smoking associated health effects from passive smoking or exposure to environmental tobacco smoke ETS When a cigarette is smoked approximately one half of the smoke generated is sidestream smoke SS emitted from the smoldering cigarette between puffs This SS contains essentially all of the same carcinogenic and toxic agents that have been identified in the mainstream smoke MS inhaled by the smoker SS and exhaled MS are the major components of ETS Environmental monitoring and measurements of biomarkers for ETS in the biological fluids of nonsmokers demonstrate that ETS constituents can be found at elevated levels in indoor environments where smoking occurs and that these constituents are inhaled and absorbed by nonsmokers Twenty six percent of the U S adult population or about 50 million Americans are smokers and so virtually all Americans are likely to be exposed to some amount of ETS in the home at work or in public places Measurements of biomarkers for ETS in nonsmokers confirm that nearly all Americans are exposed to ETS In view of the high levels of mortality and morbidity associated with smoking the chemical similarity between ETS and MS and the considerable likelihood for exposure of nonsmokers to ETS passive smoking is potentially a substantial public health concern The objectives of this report are to assess the risk to nonsmokers for respiratory health effects from exposure to ETS hazard identification and to estimate the population impact quantitative

population risk assessment of any such ETS attributable respiratory effects     Cigarette Smoking and Disease, 1976 United States. Congress. Senate. Committee on Labor and Public Welfare.
