Key to the Herpetofauna of the Continental United States and Canada Robert Powell, Joseph T. Collins, Errol D. Hooper, Jr., 2019-07-26 This profusely illustrated comprehensive key for identifying amphibians and reptiles from the continental United States and Canada incorporates a wealth of scientific findings Since the first edition was published in 1998 and the second in 2012 the number of currently recognized species of native amphibians and reptiles in the area covered by this key has increased from 545 to 634 to 685 and the number of established non native species has increased from 39 to 58 to 67 The increase in native taxa reflects the dynamic nature of modern systematics and the use of new especially molecular techniques to elucidate relationships and redefine species boundaries The increase in non native species reflects the porosity of the North American borders when it comes to controlling animal imports The key is easy to use and illustrated with outstanding line drawings that show details of color patterns and structures used for identification To accommodate the additional taxa the number of line drawings in this third edition has increased from 257 to 279 to 295 In addition nine maps illustrate the distributions of species that have been recognized since the publication of maps in the most recent editions of the Peterson Field Guides to the reptiles and amphibians of eastern central and western North America A large number of annotations detail current taxonomic ambiguities or disagreements and the literature cited has been expanded Collectively these features enhance opportunities to teach and learn the classification and identification of amphibians and reptiles in the continental United States and Canada

Review of the Ecology and Conservation of the Bog Turtle, Clemmys Muhlenbergii R. Bruce Bury, 1979 The bog turtle *Clemmys muhlenbergii* is variously considered to be secretive uncommon or threatened with extinction It has a disjunct distribution in the eastern United States and populations are restricted to wetlands such as bogs and swamps The turtle appears to be an omnivore It is most active in the spring and the eggs usually three to five are laid in late spring or early summer Sexual maturity in both sexes probably occurs at the plastral length of about 75 mm when the turtles are 6 to 8 years old Bog turtles apparently have small home ranges about 1 3 ha or smaller Other population features are poorly known There is concern for the plight of the bog turtle because of the continual loss of wetland habitat
