### Abstract

The human genome, comprising three billion base pairs coding for 30 000–40 000 genes, is constantly attacked by endogenous reactive metabolites, therapeutic drugs and a plethora of environmental mutagens that impact its integrity. Thus it is obvious that the stability of the genome must be under continuous surveillance. This is accomplished by DNA repair mechanisms, which have evolved to remove or to tolerate pre-cytotoxic, pre-mutagenic and pre-clastogenic DNA lesions in an error-free, or in some cases, error-prone way. Defects in DNA repair give rise to hypersensitivity to DNA-damaging agents, accumulation of mutations in the genome and finally to the development of cancer and various metabolic disorders. The importance of DNA repair is illustrated by DNA repair deficiency and genomic instability syndromes, which are characterised by increased cancer incidence and multiple metabolic alterations. Up to 130 genes have been identified in humans that are associated with DNA repair. This review is aimed at updating our current knowledge of the various repair pathways by providing an overview of DNA-repair genes and the corresponding proteins, participating either directly in DNA repair, or in checkpoint control and signaling of DNA damage.

### 1. Introduction

Fifty years after discovery of the structure of DNA (Watson and Crick, 1953), DNA repair has become one of the most interesting topics in modern biology. The sequencing of the human genome (Lander et al., 2001; Venter et al., 2001) yielded a first overview of the huge number of proteins involved in the protection of the genome. Recently, two papers compiled data of ~130 human DNA repair genes, which were cloned and sequenced. Not all of them, however, have been characterised yet as to their function (Ronen and Glickman, 2001; Wood et al., 2001). DNA-repair genes can be

sub-grouped into genes associated with signaling and regulation of DNA repair on the one hand and on the other into genes associated with distinct repair mechanisms such as mismatch repair (MMR), base excision repair (BER), nucleotide excision repair (NER), direct damage reversal and DNA double-strand break (DSB) repair. Mutations in genes involved in DNA repair are responsible for the development of tumors and various hereditary diseases characterised by complex metabolic alterations (see Table 1).

DNA repair genes and their corresponding proteins are also responsible for the development of cytostatic drug resistance in tumour cells. Historical aspects pertaining to the field of DNA repair have recently been highlighted (Friedberg, 2003) and several reviews on different areas of DNA repair appeared (Hoeijmakers, 2001; Lehmann, 2002; Lindahl, 2001; Svejstrup, 2002;

**DNA** Payam Behzadi,2021-05-19 DNA is the most important biomolecule ever discovered Indeed this molecule bears genetic information from one generation to another In this regard DNA bases have a key role in transferring genetic information and data safely However there are cellular genetic and environmental factors that may damage the different parts of DNA molecules These damages may result in mutations and cell death As such several DNA repair mechanisms have evolved Over three sections this book examines many of these mechanisms

**Correcting the Blueprint of Life** Errol C. **Molecular Mechanisms for Repair of DNA** Philip Hanawalt,2012-12-06 An age has passed in the 40 years since we first observed recovery from radiation damage in irradiated bacteria During the early 1930s we had been discussing the possibility of rapid changes after radiation exposure with Farring ton Daniels Benjamin Duggar John Curtis and others at the University of Wisconsin After working with living cells we had concluded that organisms receiving massive insults must have a wide variety of repair mechanisms available for restoration of at least some of the essential properties of the cell The problem was how to find and identify these recovery phenomena At that time I was working on a problem considered to be of great importance the existence of the so called mitogenetic rays Several hundred articles and a score of books had already appeared dealing with mitogenetic rays a type of radiation that was thought to exist in the shorter ultraviolet region Our search for mitogenetic rays necessitated the design of experiments of greatest sensitivity for the detection of ultraviolet It was vital that conditions be kept as constant as possible during exposure All the work was done at icewater temperature 3 5 C during and after exposure We knew that light was an important factor for cell recovery so all our experiments were done in dim light with the plated out cells being covered with dark cloth Our statements on the effect of visible light stimulated Kelner to search for photoreactivation as it was later called

*DNA Repair* Inna Kruman,2011-11-07 The book consists of 31 chapters divided into six parts Each chapter is written by one or several experts in the corresponding area The scope of the book varies from the DNA damage response and DNA repair mechanisms to evolutionary aspects of DNA repair providing a snapshot of current understanding of the DNA repair processes A collection of articles presented by active and laboratory based investigators provides a clear understanding of the recent advances in the field of DNA repair

*DNA Damage and Repair in Human Tissues* Betsy M. Sutherland,Avril D. Woodhead,2012-12-06 Physical and chemical agents in the environment damage the DNA of humans and pose a major threat to human health today and to the genetic integrity of human populations Although studies on isolated DNA in vitro on prokaryotes on mammalian cells in culture and on laboratory animals have provided essential background information it is now possible to study DNA damage and repair in human tissues directly New techniques of high sensitivity especially those

not requiring radioactive labeling have made possible quantitation of DNA damage and repair as well as detection of residual unrepaired DNA lesions In recent years several investigators have taken up the challenge of studying damage and repair responses in humans and we have chosen that work as the special focus of this Symposium Major advances in understanding damage and responses in human skin in blood cells and in human internal organs indicate three major themes First DNA damage levels in human tissues depend not only on the initial exposures but also on the capacity of that tissue for repair of the specific lesion type Second repair in human tissues may differ quantitatively and qualitatively from that in human cells in culture

**Mechanisms of DNA Damage and Repair** Michael G. Simic, Lawrence Grossman, Arthur C. Upton, David S. Bergtold, 2013-11-21 This book is based on the papers presented at the conference on Mechanisms of DNA Damage and Repair Implications for Carcinogenesis and Risk Assessment held at the National Bureau of Standards on June 27 1985 This volume deals with mechanisms of DNA damage and repair at the molecular level consequences of unrepaired or misrepaired damage with major emphasis on carcinogenesis drugs which bind selectively to altered and potentially damaging DNA sequences and potential utilization of DNA damage as an endpoint for assessing risks of UV light ionizing radiations chemicals drugs and hazardous agents in foods Because the induction of mutations by radiation and genotoxic chemicals has been observed to follow one hit kinetics in some instances it is generally assumed that any level of exposure to a DNA damaging agent may increase the risk of genetic disease or cancer in an exposed population At the same time however there is evidence that although the DNA of living cells is continually damaged by natural background radiation free radicals and other naturally occurring processes most of the damage is normally repaired

**DNA Repair: Mechanisms and Clinical Significance** Nas Wilson, 2021-11-16 The collection of processes required to identify and correct the damage in the DNA molecules is known as DNA repair DNA damage can be caused by metabolic activities and environmental factors Cells are not able to function properly if the integrity and accessibility of essential information gets corrupted by DNA damage So to restore the correct information various strategies have been evolved according to the type of damage occurred in the double helical structure of DNA Some of these mechanisms are single strand damage double strand breaks direct reversal and translesion synthesis In single strand damage

one of the two strands of the double helix has a defect and the other strand can be used as a template to correct the defect This book aims to shed light on some of the unexplored aspects of DNA repair and the recent researches in this field It traces the progress of this field and highlights some of its key concepts This book will provide comprehensive knowledge to the readers
