We are looking for the proper value of α to minimize $T_e(K_m, \omega)$. We note in (25) that the value of $3\alpha^2 - 4\alpha + 1$ is positive for all value of α where $\alpha > 1$, so, by increasing the value of ω, $T_e(K_m, \omega)$ will decrease. Therefore, $T_e(K_m, \omega)$ will be minimal where ω achieves its maximum value. It should be noted that the maximum value of ω is n. By considering $\omega = n$, the value of $\alpha = n$ will be even and we can see the result value of (22) which is $\frac{n-1}{2}$.

3. CONCLUSION

In this paper, edge-tenacities of two classes of graphs are calculated. For calculating the edge-tenacity of these classes, first the function in conventional edge-tenacity formula, which is supposed to be minimized, is calculated for constant number of components. Second a function with respect to the number of components and the size of components. It is shown that the size of components is a constant value and the above function may be considered as a one-variable function. This variable is just the number of components. Finding minimum of this one-variable function is well known. Our approach may be useful for calculation of tenacity and toughness in various classes of graphs.
