**The Future of Supercomputing** National Research Council,Division on Engineering and Physical Sciences,Computer Science and Telecommunications Board,Committee on the Future of Supercomputing,2003-10-08 The Committee on the Future of Supercomputing was tasked to assess prospects for supercomputing technology research and development in support of U S needs to examine key elements of context the history of supercomputing the erosion of research investment the changing nature of problems demanding supercomputing and the needs of government agencies for supercomputing capabilities and to assess options for progress This interim report establishes context including the history and current state of supercomputing application requirements technology evolution the socioeconomic context to identify some of the issues that may be explored in more depth in the second phase of the study

The Art of Multiprocessor Programming Maurice Herlihy,Nir Shavit,Victor Luchangco,Michael Spear,2020-09-08 The Art of Multiprocessor Programming Second Edition provides users with an authoritative guide to multicore programming This updated edition introduces higher level software development skills relative to those needed for efficient single core programming and includes comprehensive coverage of the new principles algorithms and tools necessary for effective multiprocessor programming The book is an ideal resource for students and professionals alike who will benefit from its thorough coverage of key multiprocessor programming issues Features new exercises developed for instructors using the text with more algorithms new examples and other updates throughout the book Presents the fundamentals of programming multiple threads for accessing shared memory Explores mainstream concurrent data structures and the key elements of their design as well as synchronization techniques from simple locks to transactional memory systems *Transactional Memory. Foundations, Algorithms, Tools, and Applications* Rachid Guerraoui,Paolo Romano,2014-12-29 The advent of multi core

architectures and cloud computing has brought parallel programming into the mainstream of software development. Unfortunately writing scalable parallel programs using traditional lock based synchronization primitives is well known to be a hard time consuming and error prone task mastered by only a minority of specialized programmers. Building on the familiar abstraction of atomic transactions Transactional Memory (TM) promises to free programmers from the complexity of conventional synchronization schemes simplifying the development and verification of concurrent programs enhancing code reliability and boosting productivity. Over the last decade TM has been subject to intense research on a broad range of aspects including hardware and operating systems support language integration as well as algorithms and theoretical foundations. On the industrial side the major players of the software and hardware markets have been up front in the research and development of prototypal products providing support for TM systems. This has recently led to the introduction of hardware TM implementations on mainstream commercial microprocessors and to the integration of TM support for the world's leading open source compiler. In such a vast interdisciplinary domain the Euro TM COST Action IC1001 has served as a catalyzer and a bridge for the various research communities looking at disparate yet subtly interconnected aspects of TM. This book emerged from the idea having Euro TM experts compile recent results in the TM area in a single and consistent volume. Contributions have been carefully selected and revised to provide a broad coverage of several fundamental issues associated with the design and implementation of TM systems including their theoretical underpinnings and algorithmic foundations programming language integration and verification tools hardware supports distributed TM systems self tuning mechanisms as well as lessons learnt from building complex TM based applications.
