

WASTE WATER TREATMENT PROCESS

An overview of how waste water is cleaned and treated before returning to the water supply.

(Methods vary between countries depending on water standards)

30% of the World's population does not have adequate sanitation

Source: World Health Organisation

1

Waste water and sewage is pumped underground to the lifting station where it is chemically treated and sent for separation

2

The separation process filters out solids larger than 12mm. This waste is then transported to a refuse facility and buried

3

Primary settling basins allow heavier material to sink and be stripped away. The waste is then fermented for 30 days and used as fertilizer

4

Effluent is then pumped to the two reactors for 8 hours. Through a series of stages bacteria break down harmful matter and clean the water

5

Secondary Clarifiers gravity feed the water through and bacteria continues to clean the water to a drinkable level

6

The water is finally chemically treated with chlorine to ensure it is free from bacteria. Then it passes over a weir and into the water supply
