Smoothness Priors Analysis Of Time Series:

Smoothness Priors Analysis of Time Series Genshiro Kitagawa, Will Gersch, 2012-12-06 Smoothness Priors Analysis of Time Series addresses some of the problems of modeling stationary and nonstationary time series primarily from a Bayesian stochastic regression smoothness priors state space point of view Prior distributions on model coefficients are parametrized by hyperparameters Maximizing the likelihood of a small number of hyperparameters permits the robust modeling of a time series with relatively complex structure and a very large number of implicitly inferred parameters The critical statistical ideas in smoothness priors are the likelihood of the Bayesian model and the use of likelihood as a measure of the goodness of fit of the model The emphasis is on a general state space approach in which the recursive conditional distributions for prediction filtering and smoothing are realized using a variety of nonstandard methods including numerical integration a Gaussian mixture distribution two filter smoothing formula and a Monte Carlo particle path tracing method in which the distributions are approximated by many realizations The methods are applicable for modeling time series with complex structures Smoothness Priors Analysis of Time Series Genshiro Kitagawa, Will Gersch, 1996-08-01

Advances in Processing and Pattern Analysis of Biological Signals I. Gath, G.F. Inbar, 2013-06-29 In recent years there has been rapid progress in the development of signal processing in general and more specifically in the application of signal processing and pattern analysis to biological signals Techniques such as parametric and nonparametric spectral estimation higher order spectral estimation time frequency methods wavelet transform and identification of nonlinear systems using chaos theory have been successfully used to elucidate basic mechanisms of physiological and mental processes Similarly biological signals recorded during daily medical practice for clinical diagnostic procedures such as electroencephalograms EEG evoked potentials EP electromyograms EMG and electrocardiograms ECG have greatly benefitted from advances in signal processing In order to update researchers graduate students and clinicians on the latest developments in the field an International Symposium on Processing and Pattern Analysis of Biological Signals was held at the Technion Israel Institute of Technology during March 1995 This book contains 27 papers delivered during the symposium The book follows the five sessions of the symposium The first section Processing and Pattern Analysis of Normal and Pathological EEG accounts for some of the latest developments in the area of EEG processing namely time varying parametric modeling non linear dynamic modeling of the EEG using chaos theory Markov analysis delay estimation using adaptive least squares filtering and applications to the analysis of epileptic EEG EEG recorded from psychiatric patients and sleep EEG Handbook of Brain Connectivity Viktor K. Jirsa, A.R. McIntosh, 2007-08-16 Our contemporary understanding of brain function is deeply rooted in the ideas of the nonlinear dynamics of distributed networks Cognition and motor coordination seem to arise from the interactions of local neuronal networks which themselves are connected in large scales across the entire brain The spatial architectures between various scales inevitably influence the dynamics of the brain and thereby its function But how can we

integrate brain connectivity amongst these structural and functional domains Our Handbook provides an account of the current knowledge on the measurement analysis and theory of the anatomical and functional connectivity of the brain All contributors are leading experts in various fields concerning structural and functional brain connectivity In the first part of the Handbook the chapters focus on an introduction and discussion of the principles underlying connected neural systems The second part introduces the currently available non invasive technologies for measuring structural and functional connectivity in the brain Part three provides an overview of the analysis techniques currently available and highlights new developments Part four introduces the application and translation of the concepts of brain connectivity to behavior cognition and the clinical domain

Graphical Methods for the Design of Experiments Russell R. Barton, 2012-12-06

Graphical methods have played an important role in the statistical analysis of experimental data but have not been used as extensively for experiment design at least as it is presented in most design of experiments texts Yet graphical methods are particularly attractive for the design of experiments because they exploit our creative right brain capabilities Creative activity is clearly important in any kind of design certainly for the design of an experiment The experimenter must somehow select a set of run conditions that will meet the goals for a particular experiment in a cost efficient way Graphical Methods for Experiment Design goes beyond graphical methods for choosing run conditions for an experiment It looks at the entire pre experiment planning process and presents in one place a collection of

graphical methods for defining experiment goals identifying and classifying variables for choosing a model for developing a design and for assessing the adequacy of a design for estimating the unknown coefficients in the proposed statistical model In addition tools for developing a design also provide a platform for viewing the results of the experiment a platform that provides insights that cannot be obtained by examination of regression coefficients These techniques can be applied to a variety of situations including experimental runs of computer simulation models Factorial and fractional factorial designs are the focus of the graphical representations although mixture experiments and experiments involving random effects and blocking are designed and represented in similar ways

Stochastic Population Models James H. Matis, Thomas R. Kiffe, 2012-12-06 This monograph has been heavily influenced by two books One is Ren shaw s 82 work on modeling biological populations in space and time It was published as we were busily engaged in modeling African bee dispersal and provided strong affirmation for the stochastic basis for our ecological modeling efforts The other is the third edition of Jacquez 28 classic book on compartmental analysis He reviews stochastic compartmental analysis and utilizes generating functions in this edition to derive many useful results We interpreted Jacquez use of generating functions as a message that the day had come for modeling practitioners to consider using this powerful approach as a model building tool We were inspired by the idea of using generating functions and related methods for two purposes The first is to integrate seamlessly our previous research centering in stochastic compartmental modeling with our more recent research focusing on stochastic population modeling The second related purpose is to present some key research results of practical application in a natural user friendly way to the large user communities of compartmental and biological population modelers One general goal of this monograph is to make a case for the practical utility of the various stochastic population models In accordance with this objective we have chosen to illustrate the various stochastic models using four primary applications described in Chapter 2 In so doing this monograph is based largely on our own published work

Discretization and MCMC Convergence Assessment Christian P. Robert, 1998-08-13 This monograph proposes several approaches to convergence monitoring for MCMC algorithms which are centered on the theme of discrete Markov chains After a short introduction to MCMC methods including recent developments like perfect simulation and Langevin Metropolis Hastings algorithms and to the current convergence diagnostics the contributors present the theoretical basis for a study of MCMC convergence using discrete Markov chains and their specificities The contributors stress in particular that this study applies in a wide generality starting with latent variable models like mixtures then extending the scope to chains with renewal properties and concluding with a general Markov chain They then relate the different connections with discrete or finite Markov chains with practical convergence diagnostics which are either graphical plots allocation map divergence graph variance stabilizing normality plot

stopping rules normality stationarity stability tests or confidence bounds divergence asymptotic variance normality Most of the quantitative tools take advantage of manageable versions of the CLT The different methods proposed here are first evaluated on a set of benchmark examples and then studied on three full scale realistic applications along with the standard convergence diagnostics A hidden Markov modelling of DNA sequences including a perfect simulation implementation a latent stage modelling of the dynamics of HIV infection and a modelling of hospitalization duration by exponential mixtures The monograph is the outcome of a monthly research seminar held at CREST Paris since 1995 The seminar involved the contributors to this monograph and was led by Christian P Robert Head of the Statistics Laboratory at CREST and Professor of Statistics at the University of Rouen since 1992 **Empirical Bayes and Likelihood Inference** S.E. Ahmed,N.

Reid,2012-12-06 Bayesian and likelihood approaches to inference have a number of points of close contact especially from an asymptotic point of view Both approaches emphasize the construction of interval estimates of unknown parameters Empirical Bayes methods have historically emphasized instead the construction of point estimates In this volume researchers present recent work on several aspects of Bayesian likelihood and empirical Bayes methods presented at a workshop held in Montreal Canada The goal of the workshop was to explore the linkages among the methods and to suggest new directions for research in the theory of inference Measuring Risk in Complex Stochastic Systems J. Franke,Wolfgang Härdle,Gerhard

Stahl,2012-12-06 Complex dynamic processes of life and sciences generate risks that have to be taken The need for clear and distinctive definitions of different kinds of risks adequate methods and parsimonious models is obvious The identification of important risk factors and the quantification of risk stemming from an interplay between many risk factors is a prerequisite for mastering the challenges of risk perception analysis and management successfully The increasing complexity of stochastic systems especially in finance have catalysed the use of advanced statistical methods for these tasks The methodological approach to solving risk management tasks may however be undertaken from many different angles A financial institution may focus on the risk created by the use of options and other derivatives in global financial processing an auditor will try to evaluate internal risk management models in detail a mathematician may be interested in analysing the involved nonlinearities or concentrate on extreme and rare events of a complex stochastic system whereas a statistician may be interested in model and variable selection practical implementations and parsimonious modelling An economist may think about the possible impact of risk management tools in the framework of efficient regulation of financial markets or efficient allocation of capital
