The Memory Of The Drift:

The Memory of the Drift Paul Holman, 2001 Poetry He selected the great closed helmet it might have fitted god or hobgoblin The borrowed tape of star music pleased him his trumpet of helium from i the genii of a secret state So begins THE MEMORY OF THE DRIFT a numbered sequence of poems that in part gives the erasure of original material equal status with its rewriting and rearrangement This blur of angels the trace of a more brilliant language Some diminish into cloud too rapid birds flicker find a common shape in flower star Medusa s head their sign Saddlestapled chapbook The Memory of the Drift Paul Holman, 2007

Durable Phase-Change Memory Architectures, 2020-02-24 Advances in Computers Volume 118 the latest volume in this innovative series published since 1960 presents detailed coverage of new advancements in computer hardware software theory design and applications Chapters in this updated release include Introduction to non volatile memory technologies The emerging phase change memory Phase change memory architectures Inter line level schemes for handling hard errors in PCMs Handling hard errors in PCMs by using intra line level schemes and Addressing issues with MLC Phase change Memory *Scalability and Reliability of Phase Change Memory* SangBum Kim, 2010 Various memory devices are being widely used for a wide range of applications There has not been any universal memory device so far because each memory device has a unique set of features Large performance gaps in various dimensions of features between memory devices and a new set of features required by new electronic systems such as portable electronics open up new opportunities for new memory devices to emerge as mainstream memory devices Besides the imminent scaling limit for existing mainstream memory devices also motivates development and research of new memory devices which can meet the increasing demand for large memory capacity Phase change memory PCM is one of the most promising emerging memory devices It has the potential to combine DRAM like features such as bit alteration fast read and write and good endurance and Flash like features such as non volatility and a simple structure PCM is expected to be a highly scalable technology extending beyond scaling limit of existing memory devices Prototypical PCM chips have been developed and are being tested for targeted memory applications However understanding of fundamental physics behind PCM operation is still lacking because the key material in PCM devices the chalcogenide is relatively new for use in solid state devices Evaluation and development of PCM technology as successful mainstream memory devices require more study on PCM devices This thesis focuses on issues relevant to scalability and reliability of PCM which are two of the most important qualities that new emerging memory devices should demonstrate We first study basic scaling rule based on thermoelectric analysis on the maximum temperature in a PCM cell and show that both isotropic and non isotropic scaling result in constant programming voltage The minimum programming voltage is determined by material properties such as electrical resistivity and thermal conductivity regardless of the device size These results highlight first order principles governing scaling rules In the first order scaling rule analysis we assume that material properties are constant regardless of its physical size However when materials are scaled down to the nanometer regime material properties can change because the relative contribution from the surface property to the overall system property increases compared to that from the bulk property We study scaling effect on material property and device characteristics using a novel device structure a PCM cell with a pseudo electrode With the pseudo electrode PCM cell we can accurately relate the observed properties to the amorphous region size We show that threshold switching voltage

scales linearly with thickness of the amorphous region and threshold switching field drifts in time after programming We also show that the drift coefficient for resistance drift stays the same for scaled devices These property scaling results provide not only estimates for scaled device characteristics but also clues for modeling and understanding mechanisms for threshold switching and drift To make scaled memory cells in an array form not only memory device elements but also selection devices need to be scaled PCM requires relatively large programming current which makes it challenging to scale down selection devices We integrate Ge nanowire diodes as selection devices in search for new candidates for high density PCM Ge nanowire diode provides on off ratio of 100 and small contact area of 40 nm in diameter which results in programming current below 200 μ A The processing temperature for Ge nanowire diode is below 400 C which makes Ge nanowire diode a potential enabler for 3D integration As memory devices are scaled down more serious reliability issues arise We study the reliability of PCM using a novel structure micro thermal stage MTS The high resistance state RESET resistance and threshold switching voltage are important device characteristics for reliable operation of PCM devices We study the drift behavior of RESET resistance and threshold switching voltage and its temperature dependence using the MTS Results show that the drift coefficient increases proportionally to annealing temperature until it saturates The analytical drift model for time varying annealing temperature that we derive from existing phenomenological drift models agrees well with the measurement results The analytical drift model can be used to estimate the impact of thermal disturbance program disturbance on RESET resistance and threshold switching voltage Thermal disturbance is a unique disturbance mechanism in PCM which is caused by thermal diffusion from a cell being programmed The MTS can effectively emulate the short heat pulse enabling detailed study on thermal disturbance impact on cell characteristics We show that random thermal disturbance can result in at least 25 and 100 % variations in RESET resistance and threshold switching voltage The existing model on how to add up the impact of thermal disturbance on crystallization is experimentally verified using the MTS Based on measurement and modeling results we propose a new programming scheme to improve stability of PCM with a short time annealing pulse

Differences in Perceptual Decision Making Joseph W. Houpt,Cheng-Ta Yang,James T. Townsend,2017-01-18 To deal with the abundant amount of information in the environment in order to achieve our goals human beings adopt a strategy to accumulate some information and filter out other information to ultimately make decisions Since the development of cognitive science in the 1960s researchers have been interested in understanding how human beings process and accumulate information for decision making Researchers have conducted extensive behavioral studies and applied a wide range of modeling tools to study human behavior in simple detection tasks and two choice decision tasks e g discrimination classification In general researchers often assume that the manner in which information is processed for decision making is invariant across individuals given a particular experimental context Independent variables including speed accuracy instructions stimulus properties i e intensity and characteristics of the participants i e aging cognitive ability are assumed to affect the parameters in a model i e speed of information accumulation response bias but not the way that participants process information e g the order of information processing Given these assumptions much modeling has been accomplished based on the grouped data rather than the individual data However a growing number of studies have demonstrated that there were individual differences in the perceptual decision process In the same task context different groups of the participants may process information in different manners The capacity and architecture of the decision mechanism were found to vary across individuals implying that humans decision strategies can vary depending on the context to maximize their performance In this special issue we focused on a particular subset of cognitive models particularly accumulator models multinomial processing trees and systems factorial technology SFT as applied to perceptual decision making The motivation for the focus on perceptual decision making is threefold Empirical studies of perception have grown out of a history of making a large number of observations for each individual so as to achieve precise estimates of each individual s performance This type of data rather than a small number of observations per individual is most amenable to achieving

precision in individual level and group level cognitive modeling Second the interaction between the acquisition of perceptual information and the decisions based on that information to the extent that those processes are distinguishable offers rich data for scientific exploration Finally there is an increasing interest in the practical application of individual variation in perceptual ability whether to inform perceptual training and expertise or to guide personnel decisions Although these practical applications are beyond the scope of this issue we hope that the research presented herein may serve as the foundation for future endeavors in that domain
