

CHAPTER 4

Physiology of Human Aging

by Helaine Alessio

"Aging defies easy definition, at least in biological terms. It is not merely the passage of time. It is the manifestation of biological events that occur over a span of time. The biology of aging has come a long way from being the domain of quacks and merchandisers bent on exploiting people's vanity to sell cosmetic repairs. Today it is one of the last major biological frontiers" (Hayflick, 1994).

One of the most fascinating areas of research and personal interest in aging is the physiology of aging. Practical questions, such as, "How will my body look and function over time?" or basic research questions, such as, "What controls the body's rate of aging?" are key questions asked by individuals interested in living long, healthy lives and researchers interested in understanding the physiological dimensions of aging. In this chapter you will be introduced to the basic concepts relating to the physiology of aging. We will describe how scientists separate universal age-related changes from both the usual changes we see and from disease. We will cover some key ways we evaluate physiological aging, and some contemporary theories among those studying the physiology of aging to explain how aging occurs in the body and its systems.

What Is Physiological Aging?

Physiological aging refers to changes with the passage of time in the structure and processes of tissues, major organs and systems of the body that can ultimately affect our health, behavior, functional capacity, and survival. But not all of the changes that we see in older persons are due to physiological aging. While many persons experience similar physiological changes over time, some changes are not inevitable. Results from longitudinal studies, following large numbers of people over many years, reveal new information about physiological aging that helps us to understand two key distinctions: the first is between "usual" aging and "inevitable" aging, and the second distinction is between "normal" aging and "disease."

Usual and Inevitable Aging

We have all observed changes in the health and physical bodies of individuals as they age. But which of these changes are inescapable? Do our actions or inactions in terms of our own health bring about some of the changes? The distinction between usual and inevitable aging is one dimension of the answer.

Buchsbaum, 2012-12-06 Nearly one half of an American woman's life is spent after the cessation of reproductive function A woman of 40 years has an additional life expectancy of nearly 40 years a woman of 75 over 11 years This pattern of longevity is likely to continue so that by the year 2000 it has been estimated 30 percent of the female population will be postmenopausal While it is difficult to separate the results of aging from those of estrogen deprivation it is important that we try to do so since the results of the latter are amenable to treatment The medical infirmities resulting from estrogen deprivation take a high toll among postmenopausal women Nearly 200 000 hip fractures occur annually in this group resulting in 15 000 deaths and a high morbidity rate Sleep disorders compromised sexuality psychomotor alterations of the climacterium and urinary tract disorders all contribute to a lowered quality of life Appropriate treatment of these disturbing postmenopausal conditions requires an understanding of the underlying biochemical endocrinologic psychologic and pathophysiologic alterations of estrogen deprivation Toward this end the reader will find herein chapters dealing with estrogen metabolism in the postmenopausal female end organ response to estrogen deprivation and bone metabolism and osteoporosis Next the reader will find chapters dealing with specific organ systems or conditions related to the quality of life for example sexuality urinary tract problems sleep disorders the breast sports and exercise the climacteric and the psychobiology of the menopause *The Aging Brain* Ted Burch, 1981 **Physiological Basis of Aging and Geriatrics** Paola S. McGee-Lawrence, Frank J. Secreto, Farhan A. Syed, 2013-05-29 The skeleton is a multifunctional organ system that serves several vital roles in the body Although bone has the ability to remodel itself to repair damage and respond to calcium demands it is subject to the rigors of aging hormonal changes and environment Understanding the mechanisms that cause bone loss is an important facet of human medicine Animal models permit mechanistic study of processes that regulate development and maintenance of skeletal mass enabling meticulous investigation of new orthopedic strategies or bone targeted pharmacologic therapies The selection of an appropriate animal model choice of skeletal analysis techniques and proper interpretation of data are vital components of experimental design and analysis in bone research In this chapter we review time tested criteria for choosing appropriate animal models describe several common animal models of osteoporosis and summarize some of the basic methodology available for in vivo ex vivo and in vitro analysis of skeletal biology
