Krasner,2010-01-01 **The Microbiological Safety of Low Water Activity Foods and Spices** Joshua B. Gurtler,Michael P. Doyle,Jeffrey L. Kornacki,2014-12-08 Low water activity aw and dried foods such as dried dairy and meat products grain based and dried ready to eat cereal products powdered infant formula peanut and nut pastes as well as flours and meals have increasingly been associated with product recalls and foodborne outbreaks due to contamination by pathogens such as Salmonella spp and enterohemorrhagic E coli In particular recent foodborne outbreaks and product recalls related to Salmonella contaminated spices have raised the level of public health concern for spices as agents of foodborne illnesses Presently most spices are grown outside the U S mainly in 8 countries India Indonesia China Brazil Peru Madagascar Mexico

and Vietnam Many of these countries are under developed and spices are harvested and stored with little heed to sanitation The FDA has regulatory oversight of spices in the United States however the agency's control is largely limited to enforcing regulatory compliance through sampling and testing only after imported foodstuffs have crossed the U S border Unfortunately statistical sampling plans are inefficient tools for ensuring total food safety As a result the development and use of decontamination treatments is key This book provides an understanding of the microbial challenges to the safety of low aw foods and a historic backdrop to the paradigm shift now highlighting low aw foods as vehicles for foodborne pathogens Up to date facts and figures of foodborne illness outbreaks and product recalls are included Special attention is given to the uncanny ability of Salmonella to persist under dry conditions in food processing plants and foods A section is dedicated specifically to processing plant investigations providing practical approaches to determining sources of persistent bacterial strains in the industrial food processing environment Readers are guided through dry cleaning wet cleaning and alternatives to processing plant hygiene and sanitation Separate chapters are devoted to low aw food commodities of interest including spices dried dairy based products low aw meat products dried ready to eat cereal products powdered infant formula nuts and nut pastes flours and meals chocolate and confectionary dried teas and herbs and pet foods The book provides regulatory testing guidelines and recommendations as well as guidance through methodological and sampling challenges to testing spices and low aw foods for the presence of foodborne pathogens Chapters also address decontamination processes for low aw foods including heat steam irradiation microwave and alternative energy based treatments

Britton, Patrice D. Cani, 2020-07-02 Examining the enormous potential of microbiome manipulation to improve health Associations between the composition of the intestinal microbiome and many human diseases including inflammatory bowel disease cardiovascular disease metabolic disorders and cancer have been elegantly described in the past decade Now whole genome sequencing bioinformatics and precision gene editing techniques are being combined with centuries old therapies such as fecal microbiota transplantation to translate current research into new diagnostics and therapeutics to treat complex diseases Bugs as Drugs provides a much needed overview of microbes in therapies and will serve as an excellent resource for scientists and clinicians as they carry out research and clinical studies on investigating the roles the microbiota plays in health and disease In Bugs as Drugs editors Robert A Britton and Patrice D Cani have assembled a fascinating collection of reviews that chart the history current efforts and future prospects of using microorganisms to fight disease and improve health Sections cover traditional uses of probiotics next generation microbial therapeutics controlling infectious diseases and indirect strategies for manipulating the host microbiome Topics presented include How well established probiotics support and improve host health by improving the composition of the intestinal microbiota of the host and by modulating the host immune response The use of gene editing and recombinant DNA techniques to create tailored probiotics and to characterize next generation beneficial microbes For example engineering that improves the anti inflammatory profile of probiotics can reduce the number of colonic polyps formed and lactobacilli can be transformed into targeted delivery systems carrying therapeutic proteins or bioengineered bacteriophage The association of specific microbiota composition with colorectal cancer liver diseases osteoporosis and inflammatory bowel disease The gut microbiota has been proposed to serve as an organ involved in regulation of inflammation immune function and energy homeostasis Fecal microbiota transplantation as a promising treatment for numerous diseases beyond C difficile infection Practical considerations for using fecal microbiota transplantation are provided while it is acknowledged that more high quality evidence is needed to ascertain the importance of strain specificity in positive treatment outcomes Because systems biology approaches and synthetic engineering of microbes are now high throughput and cost effective a much wider range of therapeutic possibilities can be explored and vetted If you are looking for online access to the latest clinical microbiology content please visit www.wiley.com/learn/clinmicronow **Sterile Filtration** Maik W.
