Snowball Earth:

Snowball Earth Gabrielle Walker, 2007-12-18 Did the Earth once undergo a super ice age one that froze the entire planet from the poles to the equator In *Snowball Earth* gifted writer Gabrielle Walker has crafted an intriguing global adventure story following maverick scientist Paul Hoffman's quest to prove a theory so audacious and profound that it is shaking the world of earth sciences to its core In lyrical prose that brings each remote and alluring locale vividly to life Walker takes us on a thrilling natural history expedition to witness firsthand the supporting evidence Hoffman has pieced together That evidence he argues shows that 700 million years ago the Earth did indeed freeze over completely becoming a giant snowball in the worst climatic catastrophe in history Even more startling is his assertion that instead of ending life on Earth this global deep freeze was the trigger for the Cambrian Explosion the hitherto unexplained moment in geological time when a glorious profusion of complex life forms first emerged from the primordial ooze In a story full of intellectual intrigue we follow the irascible but brilliant Hoffman and a supporting cast of intrepid geologists as they scour the planet uncovering clue after surprising clue We travel to a primeval lagoon at Shark Bay in western Australia where dolphins cavort with swimmers every morning at seven and living rocks sprout out of the water like broccoli heads to the desolate and forbidding ice fields of a tiny Arctic archipelago seven hundred miles north of Norway to the surprising fossil beds that decorate Newfoundland's foggy and windswept coastline and on to the superheated salt pans of California's Death Valley Through the contours of these rich and varied landscapes Walker teaches us to read the traces of geological time with expert eyes and we marvel at the stunning feats of resilience and renewal our remarkable planet is capable of *Snowball Earth* is science writing at its most gripping and enlightening

Frozen Earth J. D. Macdougall, 2013-02-15 This is a highly readable account of the nature of ice ages throughout earth's history and the evolution of their scientific understanding since the introduction of the term by Louis Agassiz in the 1830s The shifts in opinion on the merits of the various explanations of ice ages traced by Macdougall make fascinating reading Roger Barry Director National Snow and Ice Data Center *Frozen Earth* is a thorough and compelling account of the history of ice on earth and of the scientists who uncovered the extraordinary role that ice ages have played in shaping our world Gabrielle Walker author of *Snowball Earth* A fascinating and important read Jack Repcheck author of *The Man Who Found Time* Macdougall takes us on a fascinating journey through the realm of ice age science He deciphers some of the basic mysteries of the bitter climatic regimes that have gripped the earth in the past and will probably grip it again in the future This engrossing book has important lessons for anyone concerned with global warming and future climatic change Brian Fagan author of *The Little Ice Age*

ideal reference for a wide range of scientists in earth and environmental areas of study **Earth, Our Living Planet**

Philippe Bertrand, Louis Legendre, 2021-04-21 Earth is to our knowledge the only life bearing body in the Solar System This extraordinary characteristic dates back almost 4 billion years How to explain that Earth is teeming with organisms and that this has lasted for so long What makes Earth different from its sister planets Mars and Venus The habitability of a planet is its capacity to allow the emergence of organisms What astronomical and geological conditions concurred to make Earth habitable 4 billion years ago and how has it remained habitable since What have been the respective roles of non biological and biological characteristics in maintaining the habitability of Earth This unique book answers the above questions by considering the roles of organisms and ecosystems in the Earth System which is made of the non living and living components of the planet Organisms have progressively occupied all the habitats of the planet diversifying into countless life forms and developing enormous biomasses over the past 3.6 billion years In this way organisms and ecosystems took over the Earth System and thus became major agents in its regulation and global evolution There was co evolution of the different components of the Earth System leading to a number of feedback mechanisms that regulated long term Earth conditions For millennia and especially since the Industrial Revolution nearly 300 years ago humans have gradually transformed the Earth System Technological developments combined with the large increase in human population have led in recent decades to major changes in the Earth's climate soils biodiversity and quality of air and water After some successes in the 20th century at preventing internationally environmental disasters human societies are now facing major challenges arising from climate change Some of these challenges are short term and others concern the thousand year evolution of the Earth's climate Humans should become the stewards of Earth *Our Magnetic Earth* Ronald T. Merrill, 2011-01-15

For the general public magnetism often seems more the province of new age quacks movie mad scientists and grade school teachers than an area of actual ongoing scientific inquiry But as Ronald T Merrill reveals in *Our Magnetic Earth* geomagnetism really is an enduring vibrant area of science one that offers answers to some of the biggest questions about our planet's past and maybe even its future In a clear and careful fashion he lays out the physics of geomagnetism and magnetic fields then goes on to explain how Earth's magnetic field provides crucial evidence for our understanding of continental drift and plate tectonics how and why animals ranging from bacteria to mammals sense and use the magnetic field how changes in climate over eons can be studied through variations in the magnetic field in rocks and much more Throughout Merrill peppers his scientific account with bizarre anecdotes and fascinating details from levitating pizzas to Moon missions to blackmailing KGB agents a reminder that real science can at times be stranger and more amusing than fiction A winning primer for anyone who has ever struggled with a compass or admired a ragged V of migrating geese *Our Magnetic Earth* demonstrates that education and entertainment need not be polar opposites **Making Prehistory** Derek Turner, 2007-07-05 Scientists often make surprising claims about things that no one can observe In physics chemistry and molecular biology scientists can at least

experiment on those unobservable entities but what about researchers in fields such as paleobiology and geology who study prehistory where no such experimentation is possible Do scientists discover facts about the distant past or do they in some sense make prehistory In this book Derek Turner argues that this problem has surprising and important consequences for the scientific realism debate His discussion covers some of the main positions in philosophy of science realism social constructivism empiricism and the natural ontological attitude and shows how they relate to issues in paleobiology and geology His original and thought provoking book will be of wide interest to philosophers and scientists alike *The Earth Transformed* Peter Frankopan, 2023-04-18 A NEW YORKER BEST BOOK OF THE YEAR A revolutionary new history that reveals how climate change has dramatically shaped the development and demise of civilizations across time The ebook edition now includes endnotes Anyone who purchased the book previously can re download this updated edition and access the notes Global warming is one of the greatest dangers mankind faces today Even as temperatures increase sea levels rise and natural disasters escalate our current environmental crisis feels difficult to predict and understand But climate change and its effects on us are not new In a bold narrative that spans centuries and continents Peter Frankopan argues that nature has always played a fundamental role in the writing of history From the fall of the Moche civilization in South America that came about because of the cyclical pressures of El Niño to volcanic eruptions in Iceland that affected Egypt and helped bring the Ottoman empire to its knees climate change and its influences have always been with us Frankopan explains how the Vikings emerged thanks to catastrophic crop failure why the roots of regime change in eleventh century Baghdad lay in the collapse of cotton prices resulting from unusual climate patterns and why the western expansion of the frontiers in North America was directly affected by solar flare activity in the eighteenth century Again and again Frankopan shows that when past empires have failed to act sustainably they have been met with catastrophe Blending brilliant historical writing and cutting edge scientific research *The Earth Transformed* will radically reframe the way we look at the world and our future

Earth System Science Timothy Lenton, 2016 Earth System Science regards the Earth as an integrated system of interacting atmosphere oceans rocks and biosphere In this Very Short Introduction Tim Lenton explores its development over 4.6 billion years its present state and its future **Earth's Evolving Systems** Martin, 2016-12-16 Earth's Evolving Systems The History of Planet Earth Second Edition is an introductory text designed for popular courses in undergraduate Earth history Written from a systems perspective it provides coverage of the lithosphere hydrosphere atmosphere and biosphere and discussion of how those systems interacted over the course of geologic time *The Oceans* Eelco J. Rohling, 2017-11-21 The 4.4 billion year history of the oceans and their role in Earth's climate system It has often been said that we know more about the moon than we do about our own oceans In fact we know a great deal more about the oceans than many people realize Scientists know that our actions today are shaping the oceans and climate of tomorrow and that if we continue to act recklessly the consequences will be dire In this timely and accessible book Eelco Rohling traces the 4.4 billion year history of

Earth's oceans while also shedding light on the critical role they play in our planet's climate system. Beginning with the formation of primeval Earth and the earliest appearance of oceans, Rohling takes readers on a journey through prehistory to the present age, vividly describing the major events in the ocean's evolution from snowball and greenhouse Earth to the end-Permian mass extinction, the breakup of the Pangaea supercontinent, and the changing climate of today. Along the way, he explores the close interrelationships of the oceans, climate, solid Earth processes, and life, using the context of Earth and ocean history to provide perspective on humankind's impacts on the health and habitability of our planet and on what the future may hold for us. An invaluable introduction to the cutting-edge science of paleoceanography, *The Oceans* enables you to make your own informed opinions about the environmental challenges we face as a result of humanity's unrelenting drive to exploit the world ocean and its vital resources.

Alien Ocean Stefan Helmreich, 2023-09-01 *Alien Ocean* immerses readers in worlds being newly explored by marine biologists: worlds usually out of sight and reach, the deep sea, the microscopic realm, and oceans beyond national boundaries. Working alongside scientists at sea and in labs in Monterey Bay, Hawaii, the Woods Hole Oceanographic Institution, and the Sargasso Sea, and at undersea volcanoes in the eastern Pacific, Stefan Helmreich charts how revolutions in genomics, bioinformatics, and remote sensing have pressed marine biologists to see the sea as animated by its smallest inhabitants: marine microbes. Thriving in astonishingly extreme conditions, such microbes have become key figures in scientific and public debates about the origin of life, climate change, biotechnology, and even the possibility of life on other worlds. *Alien Ocean* immerses readers in worlds being newly explored by marine biologists: worlds usually out of sight and reach, the deep sea, the microscopic realm, and oceans beyond national boundaries. Encyclopedia of Global Warming and Climate Change, Second Edition S. George Philander, 2012-06-13 The First Edition of the *Encyclopedia of Global Warming and Climate Change* provided a multi-authored academic yet non-technical resource for students and teachers to understand the importance of global warming, to appreciate the effects of human activity and greenhouse gases around the world, and to learn the history of climate change and the research enterprise examining it. This edition was well received with notable reviews. Since its publication, the debate over the advent of global warming, at least partially brought on by human enterprise, has continued to ebb and flow, depending literally on the weather, politics, and media coverage of climate summits and debates. Advances in research also change the discourse as new data is collected and new scientific projects continue to explore and explain global warming and climate change. Thus, a new Second Edition updates more than half of the original entries and adds new perspectives and content to keep students and researchers up to date in a field that has proven provocatively lively.

Solar Activity and Earth's Climate Rasmus E. Benestad, 2002 In its revised 2nd edition, this book examines current understanding of the relationship between sunspots and the Earth's climate. Opening with a brief historical review, the text moves on to scrutinize the various current hypotheses. The focus is on how information on the solar cycle and Earth's climate is gathered and

includes discussion of observations methodology and the physics involved with the necessary statistics and analysis also provided

Global Neoproterozoic Petroleum Systems Jonathan Craig, 2009 Worldwide Neoproterozoic successions are major hydrocarbon producers In North Africa large basins with significant surface outcrops and thick sedimentary fills are widespread These basins are now emerging as potential sources of hydrocarbons and are attracting interest both from geological researchers and the oil and gas industry This volume focuses on recent developments in the understanding and correlation of North African basin fills and explores novel approaches to prospecting for source and reservoir rocks The papers cover aspects of petroleum prospectivity and age equivalent global petroleum systems Neoproterozoic tectonics and paleogeography sequence stratigraphy glacial events and global climatic models faunal and floral evolution and the deposition of early source rocks The broader aim is to compare with and learn from well studied Neoproterozoic successions globally including major environmental change the emergence of life the global carbon cycle and implications for hydrocarbon exploration

Rare Earth Peter D. Ward, Donald Brownlee, 2007-05-08 In November 12 2002 Dr John Chambers of the NASA Ames Research Center gave a seminar to the Astrobiology Group at the University of Washington The audience of about 100 listened with rapt attention as Chambers described results from a computer study of how planetary systems form The goal of his research was to answer a deceptively simple question How often would newly forming planetary systems produce Earth like planets given a star the size of our own sun By Earth like Chambers meant a rocky planet with water on its surface orbiting within a star's habitable zone This not too hot and not too cold inner region relatively close to the star supports the presence of liquid water on a planet surface for hundreds of millions of years the time span probably necessary for the evolution of life To answer the question of just how many Earth like planets might be spawned in such a planetary system Chambers had spent thousands of hours running highly sophisticated modeling programs through arrays of powerful computers The results presented at the meeting were startling The simulations showed that rocky planets orbiting at the right distances from the central star are easily formed but they can end up with a wide range of water content Earth seems to be quite a gem a rocky planet where not only can liquid water exist for long periods of time but where water can be found as a healthy ocean not too little and not too much Our planet seems to reside in a benign region of the Galaxy where comet and asteroid bombardment is tolerable and habitable zone planets can commonly grow to Earth size Such real estate in our galaxy perhaps in any galaxy is prime for life And rare as well
