The laws of the web: Patterns in the ecology of information by Bernardo A Huberman. The MIT Press, 5, Cambridge Center, Cambridge, MA 02142, USA, 2001, pp.105, \$ 24.95.

In this slim volume of less than 100 pages, the author discusses some interesting phenomenological observations on the web and how they can be used in better designs, for example, search engines. The book is aimed at the 'layman' though many of the intuitions discussed in the book have been inspired by models in physics (statistical mechanics, etc.) and many active workers in this field are also physicists.

The first empirical observation, after large statistical studies on the web, is that of the power law governing many relations such as the number of pages per site and the number of outgoing or incoming links to a page. This property is often termed as the self-similarity, i.e., the existence of the same distribution at all length scales. Because of this law, the average behaviour of the system is not that of the mode. A lognormal distribution results if we assume that changes in the sizes of sites over time are proportional to their sizes with random multiplicative factors. For power law (instead of the lognormal), two more factors are needed: sites appear at different times and that sites grow at different rates. The power law is similar to Zipf's law in linguistics where the frequency of the k th most occurring word in a language is inversely proportional to k .

Another interesting phenomenon is that of the 'small worlds': the existence of a chain of about 6–7 acquaintances before closure. On the web, it has been shown that four clicks are enough to navigate from a given random web site to another. This can be used to design better search engines: for any search, one can get the page rank (the frequency with which a page is referred to) and the closeness of the match for all the candidate pages.

Some editing errors: it would have been better to illustrate the lognormal distr with a figure when it is discussed in p. 28 than later in Ch. 7 (Fig. 7.1). The third sentence of the last para on p. 63 has some words missing. The word page rank is used without explanation in p. 38: it is unlikely to be known to a layman. In Table 8.1, the captions "% sites" and "%volume by user" need to be interchanged to be consistent with the text.

Overall, the book gives an useful insight into the dynamics of the web.

Applied computational economics and finance by M. J. Miranda and P. L. Fackler. The MIT Press, Cambridge, MA 02142, USA, 2002, pp. 510, \$70.

Many interesting economic and finance models cannot be solved analytically using mathematical techniques of algebra and calculus. This is often true of applied economic models that attempt to capture the complexities inherent in real-world economic behavior. For example, every day the financial markets bravely price trillions of dollars in such risky securities as stocks, bonds, options,

The Black Swan Nassim Nicholas Taleb, 2009-10-13 In the author's point of view a black swan is an improbable event with three principal characteristics It is unpredictable it carries a massive impact and after the fact we concoct an explanation that makes it appear less random and more predictable than it was Why do we not acknowledge the phenomenon of black swans until after they occur Part of the answer according to Taleb is that humans are hardwired to learn specifics when they should be focused on generalities We concentrate on things we already know and time and time again fail to take into consideration what we don't know We are therefore unable to truly estimate opportunities too vulnerable to the impulse to simplify narrate and categorize and not open enough to rewarding those who can imagine the impossible

From System Complexity to Emergent Properties Moulay Aziz-Alaoui, Cyrille Bertelle, 2009-08-07 Emergence and complexity refer to the appearance of higher level properties and behaviours of a system that obviously comes from the collective dynamics of that system's components These properties are not directly deducible from the lower level motion of that system Emergent properties are properties of the whole that are not possessed by any of the individual parts making up that whole Such phenomena exist in various domains and can be described using complexity concepts and thematic knowledges This book highlights complexity modelling through dynamical or behavioral systems The pluridisciplinary purposes developed along the chapters are able to design links between a wide range of fundamental and applicative Sciences Developing such links instead of focusing on specific and narrow researches is characteristic of the Science of Complexity that we try to promote by this contribution

Network Science National Research Council, Division on Engineering and Physical Sciences, Board on Army Science and Technology, Committee on Network Science for Future Army Applications, 2006-01-15 The military is currently attempting to develop itself into a force capable of networkcentric operations While this effort has highlighted the military's dependence on interacting networks it has also shown that there is a huge gap between what we need to know about networks and our fundamental knowledge about network behavior This gap makes the military vision of NCO problematic To help address this problem the Army asked the NRC to find out whether identifying and funding a new field of network science could help close this gap This report presents an examination of networks and the military an analysis of the promise content and challenges of network science and an assessment of approaches to creating value from network science
