Lackie,2012-12-06 Some years ago a book reviewer perhaps with Freudian honesty remarked that the book in question filled a much needed gap in the literature That phrase has haunted the writing of this gap filler and this preface may be considered an apologia For a number of years I have found myself teaching various groups of students about cell locomotion and cell behaviour sometimes science students specializing in cell or molecular biology sometimes immunologists or pathologists who only wanted a broad background introduction Those students who were enthusiastic or who wished to appear so asked for a general background text to explain my lectures perhaps and that is what I hope this book will provide With luck other scientists who have only a peripheral interest in cell movement will also find this a useful overview The more proximate origin of the book was a special option subject which I taught for two years to our Senior Honours Cell Biology students in Glasgow A Text Book of Physiology: Blood. **Physiology of Membrane Disorders** Thomas E. Andreoli, Darrell D. Fanestil, Joseph F. Hoffman, Stanley G. Schultz, 2013-11-11. The second edition of Physiology of Membrane Disorders represents an extensive revision and a considerable expansion of the first edition. Yet the purpose of the second edition is identical to that of its predecessor, namely to provide a rational analysis of membrane transport processes in individual membranes, cells, tissues and organs, which in turn serves as a frame of reference for rationalizing disorders in which derangements of membrane transport processes play a cardinal role in the clinical expression of disease. As in the first edition, this book is divided into a number of individual but closely related sections. Part V represents a new section where the problem of transport across epithelia is treated in some detail. Finally, Part VI, which analyzes clinical derangements, has been enlarged appreciably.

THE EDITORS xi Preface to the First Edition The purpose of this book is to provide the reader with a rational frame of reference for assessing the pathophysiology of those disorders in which derangements of membrane transport processes are a major factor responsible for the clinical manifestations of disease. In the present context we use the term membrane transport to refer to those molecular processes whose cardinal function, broadly speaking, is processes in a catholic sense, the vectorial transfer of molecules either individually or as ensembles across biological interfaces, the latter including those interfaces which separate different intracellular compartments, the cellular and extracellular compartments and secreted fluids such as glomerular filtrate and extracellular fluids.
