

Human Body: Nervous System

The nervous system is made up of the central nervous system and peripheral nervous system. These systems work together to collect and interpret data from the body's internal and external environment and control responses.

Central Nervous System

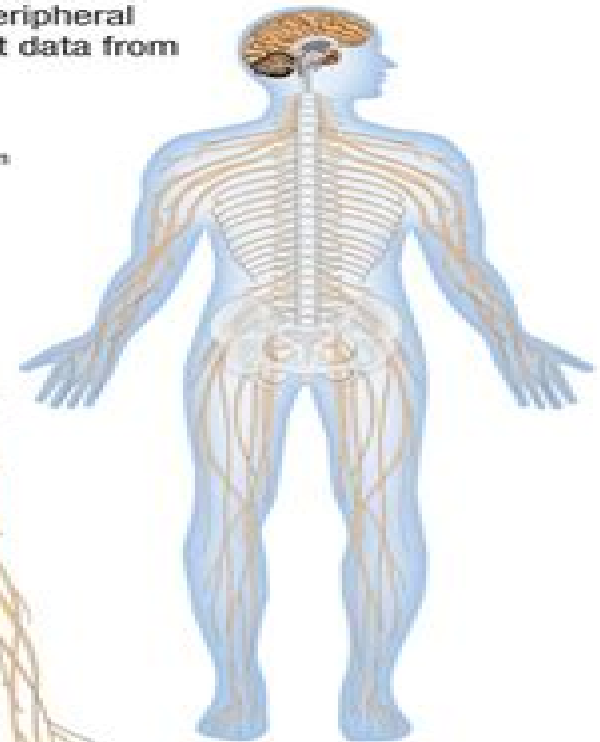

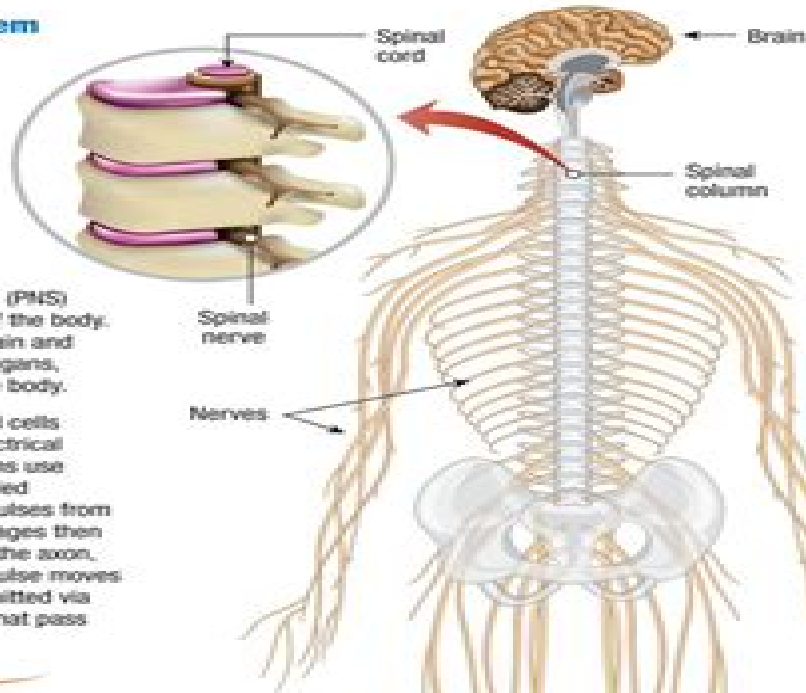

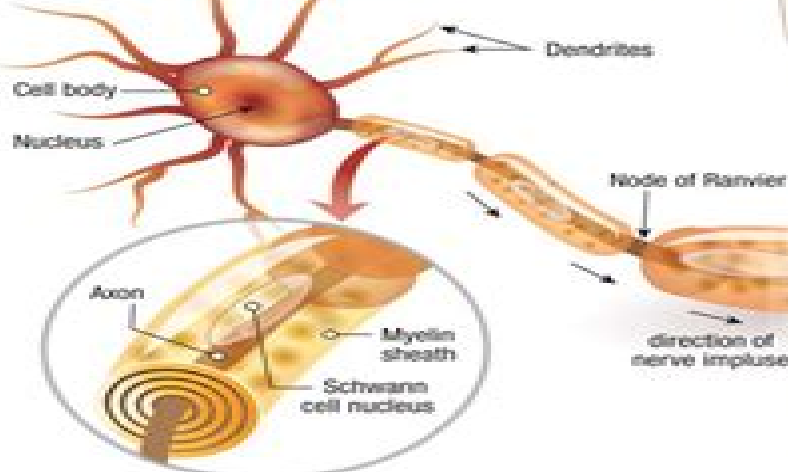

The central nervous system (CNS) manages the body's essential functions. Made up of the brain and spinal cord, the CNS receives sensory information and coordinates an appropriate response.

Peripheral Nervous System

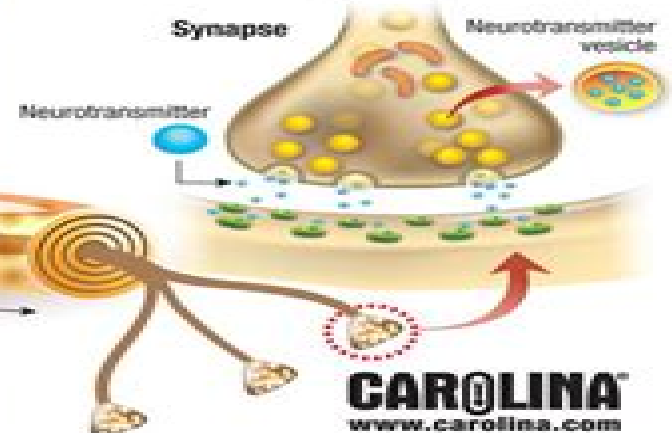

The peripheral nervous system (PNS) connects the CNS to the rest of the body. Nerves branch out from the brain and spinal cord, extending to the organs, muscles, and other parts of the body.

Neurons are highly specialized cells that transmit chemical and electrical information in the body. Neurons use short, branched extensions called dendrites to receive nerve impulses from surrounding cells. These messages then travel through the cell body to the axon, a threadlike structure. The impulse moves through the axon and is transmitted via chemical or electrical signals that pass through a synapse.

Neuron

Neurotransmitters are chemicals that relay signals between neurons and bodily tissues. Neurotransmitters include adrenaline, dopamine, and endorphins.

The Human Central Nervous System Rudolf Nieuwenhuys, Jan Voogd, Christiaan van Huijzen, 2007-12-31 The present edition of The Human Central Nervous System differs considerably from its predecessors In previous editions the text was essentially confined to a section dealing with the various functional systems of the brain This section which has been rewritten and updated is now preceded by 15 newly written chapters which introduce the pictorial material of the gross anatomy the blood vessels and meninges and the microstructure of its various parts and deal with the development topography and functional anatomy of the spinal cord the brain stem and the cerebellum the diencephalon and

the telencephalon Great pains have been taken to cover the most recent concepts and data As suggested by the front cover there is a focus on the evolutionary development of the human brain Throughout the text numerous correlations with neuropathology and clinical neurology have been made After much thought we decided to replace the full Latin terminology cherished in all previous editions with English and Anglicized Latin terms It has been an emotional farewell from beautiful terms such as decussatio hipposideriformis Wnekinkii and pontes grisei caudatolenticulares Not only the text but also the pictorial material has been extended and brought into harmony with the present state of knowledge More than 230 new illustrations have been added and many others have been revised The number of macroscopical sections through the brain has been extended considerably Together these illustrations now comprise a complete and convenient atlas for interpreting neuroimaging studies

Fundamental Properties of the Human Nervous System V. Nebylitsyn, 2013-03-08 Although today differential psychology embraces a large and ever increasing body of facts conclusions and practical recommendations which have wide applicability a number of critical problems are still unresolved or only partly resolved One of the most important of these is the relationship between individual variations in human behavior and individual features of a range of correlated physiological functions Adequate concepts exist for understanding individual variations in some physiological functions underlying specific aspects speed tempo rhythm amplitude of the flow of psychical activity This fact alone is of considerable importance especially when we consider that such dynamic features can and sometimes do in a fundamental way modulate psychological functioning If we consider in addition that in certain circumstances these variables have a direct and sometimes decisive effect on the final behavioral outcome it seems obvious that the parameters of physiologically active systems determine a number of important features of complex human behavior According to Pavlov the most important of these is that system comprising central nervous system properties which determine the generation of excitatory and inhibitory processes in the structures of the central nervous system The concept of basic nervous system properties as leading parameters of the psychophysiological organization of individuality seems to be one of the outstanding achievements of the Pavlovian school It provided the framework within which investigators could attempt to determine experimentally individual features of behavior and reactivity
