The Wild Mouse in Immunology Michael Potter, Joseph H. Nadeau, Michael P. Cancro, 2012-12-06 The present volume of *Current Topics in Microbiology and Immunology* is a series of papers on subjects that are relevant to the growing use of wild mice in immunological microbiological and genetical research Wild mice is a jargonistic term that is used chiefly in the laboratory to refer to the naturally living forms of house mice *Mus musculus* and also other species closely related to *M. musculus* This group of species is designated by systematists as the genus *Mus* Immunologists began 20 years ago to study the polymorphisms of immunoglobulins and major histocompatibility complex antigens in wild mice An extraordinary extension of the highly polymorphic array of phenotypes known in inbred mice was encountered Breeding stocks of wild mice were brought into the laboratory This included not only *M. musculus* but a so

many of the available species in the genus *Mus* from Southeast Asia and Europe. This availability led to other comparisons of wild and inbred mice and the discovery of other new and interesting phenotypes and genotypes. It became apparent that inbred strains of mice provided only a limited window for viewing the genetic diversity of *Mus musculus*.

The Mouse in Biomedical Research Henry Foster, 1981-01-01. The Mouse in Biomedical Research. Volume I. History. Genetics and Wild Mice focuses on the utility of the mouse as a laboratory animal in biomedical research. A historical perspective on the development and origins of the laboratory and wild mouse is given. The diversity of inbred strains of mice as well as the methods of developing and the genetic monitoring and testing of these strains are discussed. This volume consists of 14 chapters and begins with an overview of mice of the genus *Mus* and problems concerning evolution within the genus. The following chapters focus on taxonomy, nomenclature and breeding systems together with recombinant inbred and congenic resistant mouse strains. Methods of constructing testing and monitoring strains are described. Congenic strains, gene mapping, cytogenetics and murine experimental studies are also considered along with the histocompatibility 2 complex and radiation genetics. The final chapter is devoted to the pharmacogenetics of the laboratory mouse, paying particular attention to intoxication and detoxication pathways, genetically determined differences in xenobiotic metabolism and pharmacogenetic polymorphisms. This book will be a useful reference for investigators using mice in many areas of research.

The Coat Colors of Mice W.K. Silvers, 2012-12-06. Many investigators seem to be fascinated by the coat colors of the mammals with which they work. This seems to be the case particularly for those utilizing isogenic strains of mice, not only because such strains display widely different phenotypes but because scientists, by definition, are an inquisitive lot and it is sometimes difficult for the uninitiated to comprehend how such phenotypes are produced. This bewilderment becomes even more apparent if the investigator happens to be involved in breeding studies and a number of attractively colored animals quite different from the original stocks appear. Thus I can recall numerous occasions when my colleagues frequently working in areas completely unrelated to any aspect of genetics have come to me with an attractively pigmented animal or more likely with a population of segregating coat color types usually because they have not tended their animals properly and have ended up with a cage full of F₂S displaying a number of different colors. How they ask do such colors come about. While in some cases it is easy to take chalk in hand and explain what has been going on, segregating and why, in other cases it is virtually impossible. It is extremely difficult because while the interactions of many coat color factors obey the simple laws of heredity and of predictable gene interactions, others do not.
