Rolls,2012-01-05 Why do we have emotions What are the bases of social behaviour What is the relationship between the mind and the brain How and why do we appreciate art How do we make decisions Are there biological foundations to ethical behaviour Why do people follow religions or believe in life after death These wide ranging but important questions are just some of those considered in this exploration of the field of neuroscience and how it can crucially inform our knowledge across a range of seemingly unrelated disciplines Neuroculture considers the implications of our modern understanding of how the brain works how it was shaped by evolution and how it can help us understand many mental issues central to everyday life The book starts with a look at emotions and how they are important in our behaviour It then considers social behaviour looking at the adaptive differences between men and women The next chapter considers emotion and rationality and the mechanisms of decision making In the following chapter the author looks at philosophical issues considering the relationship between the mind and brain and considering whether the hardware software distinction in a computer might tell us something about mind brain interactions The following chapter considers neuroaesthetics the biological foundations of our appreciation of art including visual art literature and music Is art a useless ornament Is music to quote Steven Pinker really just auditory cheesecake After this the author looks at the field of neuroeconomics how neuroscience is informing us about how we make economic choices The wide ranging chapters that follow consider neuroethics the biological foundations of ethical behaviour neuropsychiatry the connection between neural functioning and psychiatric disorders neuroreligion the possible biological foundations of religious belief and neuropolitics how our knowlege of the emotion and rational reasoning systems might help us develop

**From Darwinian Metaphysics Towards Understanding the Evolution of Evolutionary Mechanisms** Momme von Sydow,2012 Although Charles Darwin predicted that his theory would give zest to metaphysics even he would be astonished at the variety of paths his theory has in fact taken This holds with regard to both gene Darwinism a purified Darwinian approach biologizing the social sciences and process Darwinism found in the disciplines of psychology philosophy of science and economics Although Darwinism is often linked to highly confirmed biological theories some of its interpretations seem to profit from tautological claims as well where scientific reputation cloaks ideological usage This book discusses central tenets

of Darwinism historically as well as systematically for example the history of different Darwinian paradigms the units of selection debate and the philosophical problem of induction as basis of metaphysical Darwinism Crucially the book addresses the Darwinian claim that evolution is governed by an immutable and unrelentingly cruel law of natural selection Paradoxically Darwins theory is a static non evolutionary theory of evolution The current book sketches the historical background and provides suggestions that may help to replace this approach by the idea of an evolution of evolutionary mechanisms see Escher s Drawing Hands on the cover This view even suggests a tendency to overcome the blindness of the knowledge acquisition of primordial Darwinian processes and allows for some freedom from external environments This book first develops a radically Darwinian approach then criticises this approach from within Even Darwinism has a tendency to transcend itself Although the book addresses several empirical issues it does not challenge particular findings Instead it builds on many insights of Darwinism and provides a proposal for interpreting known empirical evidence in a different light It should help pave the way for further developing an understanding of nature that transcends Darwinian metaphysics
