Molecular Biology of Plant Tumors Günter Kahl, Josef S. Schell, 2014-06-28 *Molecular Biology of Plant Tumors* provides an opportunity to learn in detail about the latest insights into the mechanism of transformation of plant cells by *Agrobacterium tumefaciens*. The study of the molecular mechanism responsible for the crown gall phenomenon induced by *Agrobacterium tumefaciens* illustrates the point that the fundamental study of the causes and mechanisms of abnormal growth might be one of the most efficient ways to understand cellular differentiation and the molecular basis of gene expression. The book is organized into three parts that contain research on abnormal plant growth, crown gall tumors, and potential vectors for genetic engineering in agriculture. The genetic structure responsible for the neoplastic transformation of plant cells in crown galls is a bacterial plasmid called Ti for tumor inducing. Research described in this volume demonstrates that these Ti plasmids were designed by evolution as natural gene vectors with which some bacteria can introduce active genes into plants. These transferred genes are maintained by integration in the plant genome and their expression is directly or indirectly responsible for the tumorous growth pattern. Books in Print, 1994

Cell Cycle and Cell Differentiation J. Reinert, H. Holtzer, 2013-06-29 It is instructive to compare the response of biologists to the two themes that comprise the title of this volume. The concept of the cell cycle in contrast to cell division is a relatively recent one. Nevertheless, biologists of all persuasions appreciate and readily agree on the central problems in this area. Issues ranging from mechanisms that initiate and integrate the synthesis of chromosomal proteins and DNA during S phase of mitosis to the manner in which assembly of microtubules and their interactions lead to the segregation of metaphase chromosomes are readily followed by botanists and zoologists as well as by cell and molecular biologists. These problems are crisp and well defined. The current state of cell differentiation stands in sharp contrast. This one of the oldest problems in experimental biology almost defies definition today. The difficulties arise not only from a lack of pertinent information on the regulatory mechanisms but also from conflicting basic concepts in this field. One of the ways in which this situation might be improved would be to find a broader experimental basis including a better understanding of the relationship between the cell cycle and cell differentiation. **Medical Books and Serials in Print**, 1984
