

NORTHERN HEMISPHERE

WINTER

Once dominated the northern sky, high stars form sparse lines that's thicker to the west.

At midline, stars form the outline of Ursa Major in the center, right, in the hazy, intermediate band. Part of it has stars, another part the "handle" is a belt of stars that are fainter and farther out. In the middle of this belt is the outline of Polaris, the North Star, which is the only star in the sky that is visible to the north. To the south of this belt is the outline of Ursa Minor, the Little Dipper, which is also visible to the north.

First Light and Beyond D. A. Jenkins, 2015-07-28. Amateur astronomers who have been disappointed by the results of an observing session can take comfort in the guidance of this book which advises how to still gain useful experience in seemingly failed nights at the telescope. In a world with imperfect seeing conditions, incredible observing sessions are often mixed with less inspiring ones, discouraging the amateur observer. This book is designed to minimize subsequent disappointment for astronomers who encounter a few bad observing sessions, helping novice observers take something worthwhile away each and every time they go out under the night sky regardless of the observations that were originally planned. Almost every observer remembers his first sight of ringed Saturn hanging in the blackness of space. Practitioners agree that there is something special about visual observing. Real-time observations at the eyepiece can provide fleeting yet intense feelings that connect us with the universe in unique ways. But when expectations aren't met at the eyepiece, there are other ways to profit from the practice of astronomy. These rewards, though less showy, are well worth cultivating. This is a book that will help the reader see what constitutes a successful visual observing session. It explains the nature of the objects that the observer is seeing and advises how best to use their equipment. There are many hints and tips about how best to locate, recall, and record observations, including suggestions for trips to areas where there are dark skies and to public observatories. Amateur astronomy is a journey from the urban backyard all the way to dark rural skies, and with this guide, the journey can be smooth.

The Monthly Evening Sky Map, 1912 **Ancient Mysteries** Peter James, Nick Thorpe, 2007-12-18. What was the Minotaur? Did a Welsh prince discover America? Did Robin Hood really exist? How does the Star of Bethlehem fit into the science of astronomy? Is the Vinland Map a fake? Can archaeologists use spirit messages to guide their work? For centuries, philosophers, scientists, and charlatans have attempted to decipher the baffling mysteries of our past, from the Stonehenge to the lost continent of Atlantis. Today, however, DNA testing, radiocarbon dating, and other cutting-edge investigative tools, together with a healthy dose of common sense, are guiding us closer to the truth.

Peter James and Nick Thorpe the professional historian and archaeologist team who created the acclaimed Ancient Inventions now tackle these age old conundrums presenting the latest information from the scientific community and the most startling challenges to traditional explanations of mysteries such as The rise and fall of the Maya A lost cache of Dead Sea Scrolls The curse of Tutankhamun The devastation of Sodom and Gomorrah The Nazca Lines These true mystery stories twist and turn like a good whodunit as James and Thorpe present the evidence for and against the expert theories shedding new light on humankind's age old struggle to make sense of the past The authors also make dramatic contributions of their own to the fray demonstrating persuasively that catastrophic events including the collisions of comets with the Earth long ago could explain puzzles that have baffled experts for centuries Ancient Mysteries will entertain and enlighten delight the curious and inform the serious

The Making of History's Greatest Star Map Michael Perryman,2010-03-20 From prehistoric times mankind has looked up at the night sky and puzzled at the changing positions of the stars How far away they are is a question that has confounded scientists for centuries Over the last few hundred years many scientific careers and considerable resources have been devoted to measuring their positions and motions with ever increasing accuracy And in the last two decades of the 20th century the European Space Agency developed and launched the Hipparcos satellite around which this account revolves to carry out these exacting measurements from space What has prompted these remarkable developments Why have governments been persuaded to fund them What are scientists learning from astronomy's equivalent of the Human Genome Project This book traces the subject's history explains why such enormous efforts are considered worthwhile and interweaves these with a first hand insight into the Hipparcos project and how big science is conducted at an international level The involvement of amateur astronomers and the Hipparcos contributions to climate research death stars passing close to the Sun and the search for extra solar planets and even intelligent life itself are some of the surprising facets of this unusual space mission
