Visual Informatics: Bridging Research and Practice Halimah Badioze Zaman,Peter Robinson,Maria Petrou,Patrick Olivier,Heiko Schröder,2009-11-14 Visual informatics is a field of interest not just among the information technology and computer science community but also other related fields such as engineering medical and health informatics and education starting in the early 1990s Recently the field is gaining more attention from researchers and industry It has become a multidisciplinary and transdisciplinary field related to research areas such as computer vision visualization information visualization real time image processing medical image processing image information retrieval virtual reality augmented reality pervasive visual mathematics 3D graphics multimedia fusion visual data mining visual ontology as well as services and visual culture Various efforts have been vested in different research but operationally many of these systems are not prominent in the mass market and thus knowledge and research on these phenomena within the mentioned areas need to be shared and disseminated It is for this reason that the Visual Informatics Research Group from Universiti bangsaan Malaysia UKM decided to spearhead this initiative to bring together experts in this very diversified but important research area so that more concerted efforts can be undertaken not just within the visual informatics community in Malaysia but from other parts of the world namely Asia Europe Oceania and USA This first International Visual Informatics Conference IVIC 2009 was conducted collaboratively by the visual informatics research community from the various public and private institutions of higher learning in Malaysia and hosted by UKM

Mark H. Lee,2013-03-09 An industrial robot routinely carrying out an assembly or welding task is an impressive sight More important when operated within its design conditions it is a reliable production machine which depending on the manufacturing process being automated is relatively quick to bring into operation and can often repay its capital cost within a year or two Yet first impressions can be deceptive if the workpieces deviate somewhat in size or position or worse if a gripper slips or a feeder jams the whole system may halt and look very unimpressive indeed This is mainly because the sum total of the system s knowledge is simply a list of a few variables describing a sequence of positions in space the means of moving from one to the next how to react to a few input signals and how to give a few output commands to associated machines The acquisition orderly retention and effective use of knowledge are the crucial missing techniques whose

inclusion over the coming years will transform today's industrial robot into a truly robotic system embodying the intelligent connection of perception to action. The use of computers to implement these techniques is the domain of Artificial Intelligence (AI) machine intelligence. Evidently, it is an essential ingredient in the future development of robotics, yet the relationship between AI practitioners and robotics engineers has been an uneasy one ever since the two disciplines were born.
