The Influence Of Sewage Sludge Application On Physical And Biological Properties Of Soils:

The Influence of Sewage Sludge Application on Physical and Biological Properties of Soils G. Catroux,P. L'Hermite,E. Suess,2012-12-06 The agricultural value of sewage sludges is well known and a lot of published data has demonstrated the positive effects of sludge applications on plant growth and yield These effects are probably due mainly to the nitrogen and phosphorus content of sewage sludges But as sludges are more organic than mineral we can expect an effect of the organic matter added to the soil on soil fertility Certainly in the future landspreading of sludges will be regulated taking into account pollution hazards for waters excess of nitrogen and phosphorus supply compared to plant needs and soil storage capacities and for soils excess of heavy metals supply and build up in soils There will be regulations fixing what low level of sludges may be spread each year decreasing their comparative value with respect to mineral fertilizers In this eventuality the organic value of sludges will take on a greater importance and several questions arise what is the lowest amount of sludge to be spread to have an immediate effect on soil physical properties are sludges effective on soil physical properties when spreading repeated low amounts On the other hand organic matter and soil biology are closely linked and there are few data on the possible effects beneficial or detrimental on soil organisms The Influence of Sewage

Chen,Y. Avnimelech,2012-12-06 The use of organic residues as a means of maintaining and increasing soil fertility is of long standing This tradition has been somewhat neglected since the introduction of mineral fertilizers at low cost More and more farmers and scientists are now showing renewed interest in the proper and effective use of organic residues composts and other recycled organic additives The role and function of organic amendments in modern agricultural systems have become topics of major interest in the scientific and agricultural communities Research work on residue disposal has provided new concepts on the interaction between organic components and soils as well as new handling technologies e g pelletizing of organic residues The trend to conserve energy has led scientists to study the minimal tillage system to find ways of replacing conventional inorganic fertilizers with natural organic products or microbial preparations and to develop new composting methods The drive to achieve higher yields in commercial greenhouse farming has led to a search for optimum substrates as growth media and for improved management techniques This has led to the introduction of organic substitutes for peat notably those originating from agricultural wastes Another important aspect is the current

interest in organic farming where use of synthetic chemicals is avoided or prohibited An increasing percentage of the population in highly developed countries is willing to pay premium prices for food produced on soils where inorganic fertilizers and other agricultural chemicals have not been used
