of the next generation of hadron colliders at the extreme limits of energy and luminosity In this respect the achievement of
extremely high magnetic fields and the production of accelerating rf cavities with very low losses are a crucial point in the
actual construction design of such a collider The search for superconducting materials with suitable properties to be used in
this field has gained a new impulse after the discovery of the so called high temperature superconducting compounds HTSCs
with superconducting critical temperatures higher than 100 K Besides the critical temperatures the transport performances
of this class of compounds are still very far from allowing applications in extremely high energy colliders On the other hand
in the last few years the technological and scientific improvements obtained for both the HTSCs and the conventional
superconducting materials are very promising This book reviews the recent status of R D on the rising generation of
superconducting materials for accelerator magnets and cavities and discusses novel aspects and ideas in this domain T.D.
