Functional Properties of Food Components Yeshajahu Pomeranz, 2012-12-02

Functional Properties of Food Components reviews the roles and functions of specific components in foods. It addresses three main questions: What in the biochemical make up of food components makes them tick in the production of desirable and acceptable foods? Why do those components/entities perform the way they do and often why do they fail to perform as expected? Which functions continue to be elusive and require more searching and probing? The book is organized into three parts. Part I discusses specific food components such as water, carbohydrates, corn sweeteners and wheat carbohydrates, proteins, lipids and enzymes. Part II deals with food additives and foods of the future and reviews the role of components in four well established foods: dairy, wheat, flour, malt and soybean products. Part III presents the available information and documentation on food components. This book is intended for the undergraduate with a background in the general biochemistry of natural materials but is also interested in specific information on the function of those components in foods. It is also meant for the food scientist or technologist who is familiar with food formulation and production and for any other interested reader with an appropriate background, whether managerial or scientific.
