

# Enzymes

Protein molecules that utilize the chemical and physical properties of their component amino acids to facilitate biochemical reactions that otherwise would be difficult to accomplish under physiological conditions.

- An enzyme provides a specific environment that allows the biochemical reaction to occur more rapidly.
- The distinguishing feature of an enzyme-catalyzed reaction is that it occurs within a pocket on the protein.
- This pocket is termed the active site and the molecule(s) that binds to the active site and is converted is called the substrate.
- The molecule(s) produced by the reaction is called the **product**.
