Biotransformations in Organic Chemistry Kurt Faber, 2012-12-06 The use of natural catalysts enzymes for the transformation of nonnatural man made organic compounds is not at all new they have been used for more than one hundred years employed either as whole cells cell organelles or isolated enzymes 1 2 Certainly the object of most of the early research was totally different from that of the present day Thus the elucidation of enzyme mechanisms was the main reason for biochemical pathways and research some decades ago It was mainly during the 1980s that the enormous potential of applying natural catalysts to transform non natural organic compounds was recognized What started as a trend in the late 1970s could almost be called a fashion in synthetic organic chemistry in the 1990s Although the early euphoria during the gold rush in this field seems to have eased somewhat there is still no limit to be seen for the future development of such methods As a result of this extensive recent research there have been an estimated 13 000 papers published on the subject To collate these data as a kind of super review would clearly be an impossible task and furthermore such a hypothetical book would be unpalatable for the non
