**Glycans: Molecules at the Interface of Immunity and Disease** Shoib Sarwar Siddiqui, Raghavendra Kikkeri Venkatanarayan, Stevan Springer, 2024-01-17 Glycans are complex multi-unit carbohydrate structures that cover the surfaces of cells and guide cellular interactions. Glycobiology studies the synthesis, structure, function, regulation, and evolution of glycans and glycan-binding molecules. Glycans are synthesized and added as modifications to proteins, lipids, and RNA. Though they are often associated with functions outside of cells, glycoproteins and glycolipids are most often extracellular, or secreted, glycans are also active within cells. Glycans are known to have diverse physiological roles ranging from cell adhesion, maintaining tissue structure and integrity, to molecular recognition, marking position during development, or self-identity in immunity and reproduction. Glycans also regulate cellular activity and physiological state. The families of proteins that bind glycans are called lectins. Glycans and lectins are vital in many diseases such as cancer, neurodegeneration, inflammation, allergies, asthma, and autoimmune disorders.

**Pathogenic Advances and Therapeutic Perspectives for Eosinophilic Inflammation** Florence E. Roufosse, Mats W. Johansson, 2018-12-06 With the recent approval of the first eosinophil-depleting therapeutic agents targeting the IL-5 pathway for treatment of severe eosinophilic asthma, eosinophils and eosinophilic disorders are in the limelight. Indeed, setbacks during clinical development of these compounds have revealed how much remains to be known about eosinophil biology in vivo and have nurtured profuse research both on basic eosinophil biology and on pathogenic disease mechanisms in order to better delineate the most meaningful targets for innovative therapeutic strategies. On one hand, variable degrees of eosinophil depletion observed in some compartments during IL-5 targeted treatment indicate that certain eosinophil subsets may not rely on this cytokine and/or that other important pro-eosinophilic mediators and signaling pathways are operative in vivo. On the other hand, it is

increasingly clear that disorders involving eosinophils such as asthma are the final outcome of complex interactions between diverse cell types and mediators beyond eosinophils and IL 5 These include type 2 helper T Th2 cells and innate lymphoid cells mast cells and a variety of factors that either activate eosinophils or are released by them Although a considerable amount of research has focused on asthma because it is a common condition and because management of severe asthma remains a major challenge several rare eosinophilic disorders with more homogenous features have proven to be extremely useful models to reach a better understanding of the involvement of eosinophils in tissue damage and dysfunction and of the micro environmental interactions operating within the complex network of eosinophilic inflammation Unraveling this interplay has resulted in advances in the development of molecular tools to detect disease subsets and to monitor therapeutic responses and in identification of promising new therapeutic targets This Research Topic dedicated to eosinophilic conditions covers aspects of the biology of eosinophils and closely related cells of particular relevance for drug development reports on translational research investigating pathogenic mechanisms of specific eosinophilic disorders in humans that will likely result in significant changes in the way patients are managed and presents an overview of the current advancement of targeted drug development for these conditions with a special focus on asthma [Innate Cells in the Pathogenesis of Food Allergy](#) Pamela Guerrerio, Simon Patrick Hogan, Ana Olivera, Karen Laky, 2021-09-23 Prof Simon Hogan is the co inventor on patent PCT US2018 018618 Inhibition of Unfolded Protein response for Suppressing or preventing allergic reaction to food All other Topic Editors declare no potential conflicts of interest with regard to the topic theme [Encyclopedia of Immunobiology](#), 2016-04-27 Encyclopedia of Immunobiology Five Volume Set provides the largest integrated source of immunological knowledge currently available It consists of broad ranging validated summaries on all of the major topics in the field as written by a team of leading experts The large number of topics covered is relevant to a wide range of scientists working on experimental and clinical immunology microbiology biochemistry genetics veterinary science physiology and hematology The book is built in thematic sections that allow readers to rapidly navigate around related content Specific sections focus on basic applied and clinical immunology The structure of each section helps readers from a range of backgrounds gain important understanding of the subject Contains tables pictures and multimedia features that enhance the learning process In depth coverage allows readers from a range of backgrounds to benefit from the material Provides handy cross referencing between articles to improve readability including easy access from portable devices [Allergy and Allergic Diseases A](#).
