change and preference should be given to the development of heat cold drought flood and salinity stress tolerant genotypes along with climate proofing through conventional and non conventional breeding techniques as well as exploiting the beneficial effects of CO₂ enhancement on crop growth and yield Available evidence shows that there is high probability of increase in the frequency and intensity of climate related natural hazards due to climate change and hence increase the potential threat due to climate change related natural disasters in the world At present protected cultivation and grafted seedlings are also popularizing among vegetable growers because of the huge scope as well as molecular breeding emerging insect pests diseases and postharvest quality of vegetables under this climate change scenario Moreover underexploited vegetables perennial vegetable and tuber crops have a more tolerant ability to climate vagaries compare to major vegetables which are also discussed in this book
