Stochastic Processes For Water Scientists Developments And Applications:

Stochastic Processes for Water Scientists Robin T. Clarke, 1998-10-15 The discipline of Stochastic Processes is usually treated as a branch of mathematics and there are plenty of books for mathematicians on the subject Equally there are very many books both for statisticians and environmental scientists on Time Series Analysis analysing the structure of data sequences where measurements are made at equal time intervals and are free from intermittent behaviour But this book deals with the analysis of events which occur intermittently in time and space through a very wide range of examples drawn from many areas of environmental science in which the role of water is central the book shows how the same analytical procedures can be applied to very many different problems The book's many examples include analysis of time intervals between El Niño events frequency of dry spells the relation between heavy rainfall and flooding occurrences of gravel disturbance in upland trout streams which damages trout spawn deposits and the cellular structure of rainfall The book does not aim to be an exhaustive treatment of all possible applications of stochastic process models in the environmental sciences but should be regarded as a source book Its aim is to encourage students and research workers to see how environmental problems can be put into a probabilistic framework and to draw their attention to analogous problems and solutions in other fields of environmental science in which water and the transport of material by water is an essential characteristic

Hydrologic Time Series Analysis Deepesh Machiwal, Madan Kumar Jha, 2012-03-05 There is a dearth of relevant books dealing with both theory and application of time series analysis techniques particularly in the field of water resources engineering Therefore many hydrologists and hydrogeologists face difficulties in adopting time series analysis as one of the tools for their research This book fills this gap by providing a proper blend of theoretical and practical aspects of time series analysis It deals with a comprehensive overview of time series characteristics in hydrology water resources engineering various tools and techniques for analyzing time series data theoretical details of 31 available statistical tests along with detailed procedures for applying them to real world time series data theory and methodology of stochastic modelling and current status of time series analysis in hydrological sciences In addition it demonstrates the application of most time series tests through a case study as well as presents a comparative performance evaluation of various time series tests together with four invited case studies from India and abroad This book will not only serve as a textbook for the students and teachers in water resources engineering but will also serve as the most comprehensive reference to educate researchers scientists about the theory and practice of time series analysis in hydrological sciences This book will be very useful to the students researchers teachers and professionals involved in water resources hydrology ecology climate change earth science and environmental studies

Rainfall - Runoff Modelling Keith J. Beven, 2003 Table of contents Down to Basics Runoff Processes and the Modelling Process Evolution of Rainfall Runoff Models Survival of the Fittest Data for Rainfall Runoff Modelling Predicting Hydrographs Using Models Based on Data Predicting Hydrographs Using Distributed Models Based on

Process Descriptions Hydrological Similarity and Distribution Function Rainfall Runoff Models Parameter Estimation and Predictive Uncertainty Predicting Floods Predicting the Effects of Change Revisiting the Problem of Model Choice

Modelling Interception and Transpiration at Monthly Time Steps Maria Margaretha de Groen, 2002-06-01 The book presents improved equations for monthly water resources models in particular for interception and transpiration Most of the existing monthly models do not make a distinction between interception and transpiration while this distinction is very important for management purposes Interception is direct feedback to the atmosphere important to sustain rainfall Transpiration is a good indicator for plant growth and biomass production This distinction also contributes to the estimation of recharge and therewith of runoff The derivations are based on the Markov theory for the occurrence of rain days The methodology can be used on the basis of an analysis of a few time series of daily data at a spatial scale of 300km and not necessarily of the same period as the monthly data Zimbabwe served as the case study but derived equations can be used worldwide as long as the relationship between the monthly rainfall and the mean number of rain days can be established
