Stochastic Analysis and Related Topics VII Laurent Decreusefond, Bernt Oksendal, Ali S. Üstünel, 2012-12-06 One of the most challenging subjects of stochastic analysis in relation to physics is the analysis of heat kernels on infinite dimensional manifolds The simplest nontrivial case is that of the path and loop space on a Lie group In this volume an up to date survey of the topic is given by Leonard Gross a prominent developer of the theory Another concise but complete survey of Hausdorff measures on Wiener space and its applications to Malliavin Calculus is given by D Feyel one of the most active specialists in this area Other survey articles deal with short time asymptotics of diffusion processes with values in infinite dimensional manifolds and large deviations of diffusions with discontinuous drifts A thorough survey is given of stochastic integration with respect to the fractional Brownian motion as well as Stokes formula for the Brownian sheet and a new version of the log Sobolev inequality on the Wiener space Professional mathematicians looking for an overview of the state of the art in the above subjects will find this book helpful In addition graduate students as well as researchers whose domain requires stochastic analysis will find the original results of interest for their own research The organizers acknowledge gratefully the financial help of the University of Oslo and the invaluable aid of Professor Bernt Oksendal and l Ecole Nationale Supérieure des Telecommunications

Stochastic Analysis and Related Topics H. Körezlioglu, A.S. Üstünel, 2012-12-06 This volume contains a large spectrum of work super processes Dirichlet forms anticipative stochastic calculus random fields and Wiener space analysis The first part of the volume consists of two main lectures given at the third Silivri meeting in 1990 1 Infinitely divisible random measures and superprocesses by D A Dawson 2 Dirichlet forms on infinite dimensional spaces and applications by M Rockner The second part consists of recent research papers all related to Stochastic Analysis motivated by stochastic partial differential equations Markov fields the Malliavin calculus and the Feynman path integrals We would herewith like to thank the ENST for its material support for the above mentioned meeting as well as for the initial preparation of this volume and to our friend and colleague Erhan Qmlar whose help and encouragement for the realization of this volume have been essential H Korezlioglu A S Ustünel

Dudley, M.G. Hahn, J. Kuelbs, 2012-12-06 Probability limit theorems in infinite dimensional spaces give conditions under which convergence holds uniformly over an infinite class of sets or functions Early results in

this direction were the Glivenko Cantelli Kolmogorov Smirnov and Donsker theorems for empirical distribution functions Already in these cases there is convergence in Banach spaces that are not only infinite dimensional but nonseparable But the theory in such spaces developed slowly until the late 1970 s Meanwhile work on probability in separable Banach spaces in relation with the geometry of those spaces began in the 1950 s and developed strongly in the 1960 s and 70 s We have in mind here also work on sample continuity and boundedness of Gaussian processes and random methods in harmonic analysis By the mid 70 s a substantial theory was in place including sharp infinite dimensional limit theorems under either metric entropy or geometric conditions Then modern empirical process theory began to develop where the collection of half lines in the line has been replaced by much more general collections of sets in and functions on multidimensional spaces Many of the main ideas from probability in separable Banach spaces turned out to have one or more useful analogues for empirical processes Tightness became asymptotic equicontinuity Metric entropy remained useful but also was adapted to metric entropy with bracketing random entropies and Kolchinskii Pollard entropy Even norms themselves were in some situations replaced by measurable majorants to which the well developed separable theory then carried over straightforwardly

The Dynkin Festschrift Mark I. Freidlin, 2012-12-06 Onishchik A A Kirillov and E B Vinberg who obtained their first results on Lie groups in Dynkin's seminar At a later stage the work of the seminar was greatly enriched by the active participation of 11 Pyatetskii Shapiro As already noted Dynkin started to work in probability as far back as his undergraduate studies In fact his first published paper deals with a problem arising in Markov chain theory The most significant among his earliest probabilistic results concern sufficient statistics In 15 and 17 Dynkin described all families of one dimensional probability distributions admitting non trivial sufficient statistics These papers have considerably influenced the subsequent research in this field But Dynkin's most famous results in probability concern the theory of Markov processes Following Kolmogorov Feller Doob and Ito Dynkin opened a new chapter in the theory of Markov processes He created the fundamental concept of a Markov process as a family of measures corresponding to various initial times and states and he defined time homogeneous processes in terms of the shift operators t In a joint paper with his student A

Stochastic Inequalities and Applications Evariste Giné, Christian Houdré, David Nualart, 2012-12-06 Concentration inequalities which express the fact that certain complicated random variables are almost constant have proven of utmost importance in many areas of probability and statistics This volume contains refined versions of these inequalities and their relationship to many applications particularly in stochastic analysis The broad range and the high quality of the contributions make this book highly attractive for graduates postgraduates and researchers in the above areas

Random Walks, Brownian Motion, and Interacting Particle Systems H. Kesten, R. Durrett, 1991-06-01 This collection of articles is dedicated to Frank Spitzer on the occasion of his 65th birthday The articles written by a group of his friends colleagues former students and coauthors are intended to demonstrate the major influence Frank has had on probability theory for the last 30 years and most likely will have for many

years to come Frank has always liked new phenomena clean formulations and elegant proofs He has created or opened up several research areas and it is not surprising that many people are still working out the consequences of his inventions By way of introduction we have reprinted some of Frank's seminal articles so that the reader can easily see for himself the point of origin for much of the research presented here These articles of Frank's deal with properties of Brownian motion fluctuation theory and potential theory for random walks and of course interacting particle systems The last area was started by Frank as part of the general resurgence of treating problems of statistical mechanics with rigorous probabilistic tools
