Spectrochemical Analysis Section, 1970 Spectrochemical research activities improvements in equipment and applications especially to the certification of NBS Standard Reference Materials are summarized In electron probe microanalysis a comprehensive computer correction program for accurate analysis of materials relative to single elements or simple compounds was developed an improved lithium doped silicon detector was found to provide increased resolution and improvements in microprobe instrumentation produced a high level of stability Studies of procedures for correction of x ray fluorescence measurements were made instrumental changes resulted in marked improvement in performance reliability and new applications were made In optical emission spectrometry studies were made of beryllium determination in an air pollution investigation and trace analyses were made of organic materials to parts per billion limits Methods of pre concentration of impurities are described for optical emission and isotope dilution spark source mass spectrometric analysis of ingot iron botanical materials and high purity reagents Work on Standard Reference Materials resulted in certification of stainless steel clays ferrosilicon blast furnace irons white irons lead bearing metal and ductile irons Author Methods for Analyzing Titanium Sponge and Intermediate Products P. Busch, Marianna A. Busch, 1991-01-16 Presents a unified treatment of multichannel detection systems in the uv visible range of the spectrum as they relate to multielement spectrochemical analysis Bridges the gap between the physics and engineering aspects of multichannel detection and analytical chemistry First section deals with the foundation optical principles of modern experimental spectroscopy Second section treats the basic operation of detectors for optical spectroscopy and the third discusses topics related to combining detectors with optical spectrometers to produce detection systems for multielement analysis **Report of Investigations** , 1956 Methods and Results of Spectrochemical Analysis of Biological Materials Neil Frederick Shimp, 1955 Report of Investigations. Gibbons, David E. Coleman, 2001-07-13 Amstat News asked three review editors to rate their top five favorite books in the September 2003 issue Statistical Methods for Detection and Quantification of Environmental Contamination was among those chosen This groundbreaking volume describes the

statistical theory that underlies the detection and quantification of environmental pollution both in the laboratory and in the field It presents the foundation of relating measured concentrations to true concentrations and the development of intervals of uncertainty for true concentrations and it presents a comprehensive review of the problem of estimating thresholds at which detection and quantification decisions can be made reliably The authors demonstrate the use of analytical measurements in making environmental impact decisions and in comparing environmental data to regulatory standards and naturally occurring background concentrations Taking the next step in a major evolution in the way environmental impact decisions are made Statistical Methods for Detection and Quantification of Environmental Contamination Presents statistical methods that allow the earliest possible detection and quantification of contaminants Describes procedures applicable to all environmental constituents Covers numerous state of the art approaches Includes case studies demonstrating practical applications of these approaches An indispensable handbook for scientists and engineers involved in environmental monitoring programs this book is also an important resource for public health officials waste facility managers regulators statisticians and analytical chemists
