Steinlen,2005 *The Handbook of Phonetic Sciences* William J. Hardcastle,John Laver,Fiona E. Gibbon,2012-07-13 Thoroughly revised and updated the second edition of The Handbook of Phonetic Sciences provides an authoritative account of the key topics in both theoretical and applied areas of speech communication written by an international team of leading scholars and practitioners Combines new and influential research along with articulate overviews of the key topics in theoretical and applied areas of speech communication Accessibly structured into five major sections covering experimental phonetics biological perspectives modelling speech production and perception linguistic phonetics and speech technology Includes nine entirely new chapters on topics such as phonetic notation and sociophonetics speech technology biological perspectives and prosody A streamlined and re oriented structure brings all contributions up to date with the latest research whilst maintaining the features that made the first edition so useful *Neural Mechanisms of Perceptual Categorization as Precursors to Speech Perception* Einat Liebenthal,Lynne E. Bernstein,2017-05-03 Perceptual categorization is fundamental to the brain s remarkable ability to process large amounts of sensory information and efficiently recognize objects including speech Perceptual categorization is the neural bridge between lower level sensory and higher level language processing A long line of research on the physical properties of the speech signal as determined by the anatomy and physiology of the speech production apparatus has led to descriptions of the acoustic information that is used in speech recognition e g stop consonants place and manner of articulation voice onset time aspiration Recent research has also considered what visual cues are relevant to visual speech recognition i e the visual counter parts used in lipreading or audiovisual speech perception Much of the theoretical work on speech perception was done in the twentieth century without the benefit of neuroimaging technologies and models of neural representation Recent progress in understanding the functional organization of sensory and association cortices based on advances in neuroimaging presents the possibility of achieving a comprehensive and far reaching account of perception in the service of language At the level of cell assemblies research in animals and humans suggests that neurons in the temporal cortex are important for encoding biological categories On the cellular level different classes of neurons interneurons and pyramidal neurons have been suggested to play differential roles in the neural computations underlying auditory and visual categorization The moment is ripe for a research topic focused on neural mechanisms mediating the emergence of speech representations including auditory visual and even somatosensory based forms Important progress can be achieved by juxtaposing within the same research topic the knowledge that currently exists the identified lacunae and the theories that

can support future investigations This research topic provides a snapshot and platform for discussion of current understanding of neural mechanisms underlying the formation of perceptual categories and their relationship to language from a multidisciplinary and multisensory perspective It includes contributions reviews original research methodological developments pertaining to the neural substrates dynamics and mechanisms underlying perceptual categorization and their interaction with neural processes governing speech perception Proceedings from the Institute of Phonetic Sciences of the University of Amsterdam ,1992 **Functional Phonology** Paul P. Elizabeth B Torres,Anne M Donnellan,2015-05-19 Autism Spectrum Disorders ASD is portrayed as cognitive and social disorders Undoubtedly impairments in communication and restricted repetitive behaviors that now define the disorders have a profound impact on social interactions But can we go beyond the descriptive observational nature of this definition and objectively measure that amalgamate of motions and sensations that we call behavior In this Research Topic we bring movement and its sensation to the forefront of autism research diagnosis and treatment We gather researchers across disciplines with the unifying goal of recognizing movement and sensory disturbances as core symptoms of the disorder We also hear confirmation from the perspective of autism self advocates and parents Those important sources of evidence along with the research presented in this topic demonstrate without a doubt that profound movement and sensory differences do exist in ASD and that they are quantifiable The work presented in this Research Topic shows us that quantifiable differences in movements have a better chance than current observational techniques to help us uncover subtle solutions that the nervous system with autism has already spontaneously self discovered and utilized in daily living Where the naked eye would miss the unique subtleties that help each individual cope instrumentation and fine kinematic analyses of motions help us uncover inherent capacities and predispositions of the person with autism The work presented in this topic helps us better articulate through the voices of parents and self advocates those sensory motor differences that current inventories could not possibly uncover These differences are seldom perceived as they take place at timescales and frequencies that fall largely beneath our conscious awareness To the person in the spectrum living with this disorder and to the caregiver creating accommodations to help the affected loved one these subtleties are very familiar though Indeed they are often used in clever ways to facilitate daily routines We have waited much too long in science to listen to the very people that we are trying to define understand and help Being autism a social problem by definition it is remarkable that not a single diagnosis inventory measures the dyadic social interaction that takes place between the examiner and the examinees Indeed we have conceived the autistic person within a social context where we are incapable by definition of accepting those differences The burden is rather placed on the affected person to whom much too often we refer to in the third person as non verbal without intentionality without empathy or emotions without a theory of mind among other purely psychological guesses It is then too easy and shockingly allowed to reshape that person to mold that person to better conform to our social expectations and to extinguish behaviors that are socially unacceptable even through the use of aversive punishing reinforcement techniques if need be And yet none of those techniques have had a single shred of objective scientific evidence of their effectiveness We have not objectively measured once nor have we physiologically characterized once any of those perceived features that we

so often use to observationally define what we may think the autistic phenotype may be We have not properly quantified beyond paper and pencil methods the effectiveness of interventions in autism Let us not forget when we do our science that we are all part of the broad human spectrum

### **Music, Brain, and Rehabilitation: Emerging Therapeutic**

**Applications and Potential Neural Mechanisms** Teppo Särkämö, Eckart Altenmüller, Antoni Rodríguez-Fornells, Isabelle Peretz, 2016-08-05 Music is an important source of enjoyment learning and well being in life as well as a rich powerful and versatile stimulus for the brain With the advance of modern neuroimaging techniques during the past decades we are now beginning to understand better what goes on in the healthy brain when we hear play think and feel music and how the structure and function of the brain can change as a result of musical training and expertise For more than a century music has also been studied in the field of neurology where the focus has mostly been on musical deficits and symptoms caused by neurological illness e g amusia musicogenic epilepsy or on occupational diseases of professional musicians e g focal dystonia hearing loss Recently however there has been increasing interest and progress also in adopting music as a therapeutic tool in neurological rehabilitation and many novel music based rehabilitation methods have been developed to facilitate motor cognitive emotional and social functioning of infants children and adults suffering from a debilitating neurological illness or disorder Traditionally the fields of music neuroscience and music therapy have progressed rather independently but they are now beginning to integrate and merge in clinical neurology providing novel and important information about how music is processed in the damaged or abnormal brain how structural and functional recovery of the brain can be enhanced by music based rehabilitation methods and what neural mechanisms underlie the therapeutic effects of music Ideally this information can be used to better understand how and why music works in rehabilitation and to develop more effective music based applications that can be targeted and tailored towards individual rehabilitation needs The aim of this Research Topic is to bring together research across multiple disciplines with a special focus on music brain and neurological rehabilitation We encourage researchers working in the field to submit a paper presenting either original empirical research novel theoretical or conceptual perspectives a review or methodological advances related to following two core topics 1 how are musical skills and attributes e g perceiving music experiencing music emotionally playing or singing affected by a developmental or acquired neurological illness or disorder for example stroke aphasia brain injury Alzheimer s disease Parkinson s disease autism ADHD dyslexia focal dystonia or tinnitus and 2 what is the applicability effectiveness and mechanisms of music based rehabilitation methods for persons with a neurological illness or disorder Research methodology can include behavioural physiological and or neuroimaging techniques and studies can be either clinical group studies or case studies studies of healthy subjects are applicable only if their findings have clear clinical implications

*The relationship between music and language* Lutz Jäncke, Traditionally music and language have been treated as different psychological faculties This duality is reflected in older theories about the lateralization of speech and music in that speech functions were thought to be localized

on the left and music functions on the right hemisphere But with the advent of modern brain imaging techniques and the improvement of neurophysiological measures to investigate brain functions an entirely new view on the neural and psychological underpinnings of music and speech has evolved The main point of convergence in the findings of these new studies is that music and speech functions have many aspects in common and that several neural modules are similarly involved in speech and music There is also emerging evidence that speech functions can benefit from music functions and vice versa This new research field has accumulated a lot of new information and it is therefore timely to bring together the work of those researchers who have been most visible productive and inspiring in this field and to ask them to present their new work or provide a summary of their laboratory s work
