the DIMACS special years on Mathematical Support for Molecular Biology Participants from the world over attended giving
the workshop an important international component The study of discrete mathematics and optimization with medical
applications is emerging as an important new research area Significant applications have been found in medical research for
example in radiosurgical treatment planning virtual endoscopy and more This volume presents a substantive cross section of

Summary Based on the experiences of past designs and the outcome of recent studies in the comparisons of low level image
processing architectures a pipelined system for real time low image processing has been designed and realized in CMOS
technology To minimize design pitfalls a study was performed to the details of the design solutions that have been found in
embodimentsof the three main architectural groups of image processing the Square Processor Arrays the Linear Processor
Arrays and the Pipelines This is reflected in a theoretical model As the design is based on bitplane wise processing of images
research was performed on the principles ofCellularLogic Processing of two dimensional images of binary A methodology has
been developed that is based on the transformation images using sets of Hit or Miss masks This method appeared to be
extendable to higher dimensional images A theoretical model for the generation of break point conditions in high dimensional
images has been developed and applied up to dimension three **Questar Southern Trails Pipeline Company Southern**
