Specialized Computer Architectures For Robotics And Automation:

Computer Architectures for Robotics and Automation James H. Graham, 1987 Addresses the important topic of providing adequate computational power for the demanding real time requirements of advanced robotic systems Shows how many of the recent advances in image processing control and machine intelligence can be incorporated into robotic systems in real time Explains how innovative specialized computer architectures that include both parallelism and special purpose hardware can speed the development of robot potential Cluster Computing for Robotics and Computer Vision Damian M. Lyons, 2011 In this book we look at how cluster technology can be leveraged to build better robots Algorithms and approaches in key areas of robotics and computer vision such as map building target tracking action selection and landmark learning are reviewed and cluster implementations for these are presented The objective of the book is to give professionals working in the beowulf cluster or robotics and computer vision fields a concrete view of the strong synergy between the areas as well as to spur further fruitful exploitation of this connection The book is written at a level appropriate for an advanced undergraduate or graduate student The key concepts in robotics computer vision and cluster computing are introduced before being used to make the text useful to a wide audience in these fields **Distributed Autonomous Robotic Systems 3** Tim Lueth, Rüdiger Dillmann, Paolo Dario, Heinz Wörn, 2012-12-06 Distributed autonomous robotic systems DARS are systems composed of multiple autonomous units such as modules cells processors agents and robots Combination or cooperative operation of multiple autonomous units is expected to lead to desirable features such as flexibility fault tolerance and efficiency The DARS is the leading established conference on distributed autonomous systems All papers have the common goal to contribute solutions to the very demanding task of designing distributed systems to realize robust and intelligent robotic systems Architectural Design Chris A. Vissers, Luís Ferreira Pires, Dick A.C. Quartel, Marten van Sinderen, 2016-09-30 This book presents a design methodology that is practically applicable to the architectural design of a broad range of systems It is based on fundamental design concepts to conceive and specify the required functional properties of a system while abstracting from the specific implementation functions and technologies that can be chosen to build the system Abstraction and precision are indispensable when it comes to understanding complex systems and precisely creating and representing them at a high functional level Once understood these concepts appear natural self evident and extremely powerful since they can directly precisely and concisely reflect what is considered essential for the functional behavior of a system The first two chapters present the global views on how to design systems and how to interpret terms and meta concepts This informal introduction provides the general context for the remainder of the book On a more formal level Chapters 3 through 6 present the main basic design concepts illustrating them with examples Language notations are introduced along with the basic design concepts Lastly Chapters 7 to 12 discuss the more intricate basic design concepts of interactive systems by focusing on their common functional goal These chapters are

recommended to readers who have a particular interest in the design of protocols and interfaces for various systems The didactic approach makes it suitable for graduate students who want to develop insights into and skills in developing complex systems as well as practitioners in industry and large organizations who are responsible for the design and development of large and complex systems It includes numerous tangible examples from various fields and several appealing exercises with their solutions

Recent Trends in Mobile Robots Yuan-Fang Zheng,1993 This book presents recent trends in the field as perceived by a global selection of researchers and experts Subjects covered include motion planning of mobile robots in unknown environments coordination between mobility and manipulability computation environments for mobile robots nonlinear control of mobile robots and environmental modeling using advanced sensing technologies Issues ranging from progress in applications to fundamental problems are discussed *1993 Computer Architectures for Machine Perception* Magdy A.
