Spectral Analysis and Filter Theory in Applied Geophysics Burkhard Buttkus, 2000-03-27 This state of the art survey serves as a complete overview of the subject Besides the principles and theoretical foundations emphasis is laid on practical applicability describing not only classical methods but also modern developments and their applications Students researchers and practitioners especially in the fields of data registration treatment and evaluation will find this a wealth of information

Spectral Analysis and Filter Theory in Applied Geophysics Burkhard Buttkus, 2012-12-06 This book is intended to be an introduction to the fundamentals and methods of spectral analysis and filter theory and their applications in geophysics The principles and theoretical basis of the various methods are described their efficiency and effectiveness evaluated and instructions provided for their practical application Besides the conventional methods newer methods are discussed such as the spectral analysis of random processes by fitting models to the observed data maximum entropy spectral analysis and maximum likelihood spectral analysis the Wiener and Kalman filtering methods homomorphic deconvolution and adaptive methods for nonstationary processes Multidimensional spectral analysis and filtering as well as multichannel filters are given extensive treatment The book provides a survey of the state of the art of spectral analysis and filter theory The importance and possibilities of spectral analysis and filter theory in geophysics for data acquisition processing and evaluation are illustrated with practical examples from various fields of applied geophysics Although this book was planned primarily as a textbook for a course on the analysis of geophysical time series it may also be of interest to scientists and engineers who process other digital data It provides a comprehensive discussion of the theoretical fundamentals and a compilation of the extensive literature on the subject I hope that I have succeeded in presenting the various principles and methods of time series analysis comprehensively and without error Comments on errors or suggestions for improvements are welcome

Advanced Digital Signal Processing of Seismic Data Wail A. Mousa, 2020-01-16 Seismic data must be interpreted using digital signal processing techniques in order to create accurate representations of petroleum reservoirs and the interior structure of the Earth This book provides an advanced overview of digital signal processing DSP and its applications to exploration seismology using real world examples The book begins by introducing seismic theory describing how to identify seismic events in terms of signals and noise and how to convert seismic data into the language of DSP Deterministic DSP is then covered together with non conventional sampling techniques The final part covers statistical seismic signal processing via Wiener optimum filtering deconvolution linear prediction filtering and seismic wavelet processing With over sixty end of chapter exercises seismic data sets and data processing MATLAB codes included this is an ideal resource for electrical engineering students unfamiliar with seismic data and for Earth Scientists and petroleum professionals interested in DSP techniques

Multirate Statistical Signal Processing Omid S. Jahromi, 2007-05-15 The field of multirate signal processing has witnessed a great deal of progress and an increasingly wide range of applications since the publication of the first

textbook by Crochiere and Rabiner 1983 However this progress has been mainly in the area of deterministic systems with emphasis on perfect reconstruction and or orthogonal systems This book introduces a statistical theory for extracting information from signals that have different sampling rates This new theory generalizes the conventional deterministic theory of multirate systems beyond many of its constraints Furthermore it allows for the formulation of several new problems such as spectrum estimation time delay estimation and sensor fusion in the realm of multirate signal processing I have arrived at the theory presented here by integrating concepts from diverse areas such as information theory inverse problems and theory of equalities The process of merging a variety of concepts of different origin results in both merits and shortcomings The former include the fresh and differentiated view of an amateur providing scope of application The latter include a lack of in depth experience in each of the original fields Granted this may lead to gaps in continuity however it goes without saying that a complete theory can seldom be achieved by one person and in a short time My goal in writing this book has been to inspire the reader to initiate his own research and add to the theory of multirate statistical signal processing

GPS Stochastic Modelling Xiaoguang Luo, 2013-07-06 Global Navigation Satellite Systems GNSS such as GPS have become an efficient reliable and standard tool for a wide range of applications However when processing GNSS data the stochastic model characterising the precision of observations and the correlations between them is usually simplified and incomplete leading to overly optimistic accuracy estimates This work extends the stochastic model using signal to noise ratio SNR measurements and time series analysis of observation residuals The proposed SNR based observation weighting model significantly improves the results of GPS data analysis while the temporal correlation of GPS observation noise can be efficiently described by means of autoregressive moving average ARMA processes Furthermore this work includes an up to date overview of the GNSS error effects and a comprehensive description of various mathematical methods

Dynamical Modeling of Biological Systems Stilianos Louca, 2023-06-07 This book introduces concepts and practical tools for dynamical mathematical modeling of biological systems Dynamical models describe the behavior of a system over time as a result of internal feedback loops and external forcing based on mathematically formulated dynamical laws similarly to how Newton's laws describe the movement of celestial bodies Dynamical models are increasingly popular in biology as they tend to be more powerful than

static regression models This book is meant for undergraduate and graduate students in physics applied mathematics and data science with an interest in biology as well as students in biology with a strong interest in mathematical methods The book covers deterministic models for example differential equations stochastic models for example Markov chains and autoregressive models and model independent aspects of time series analysis Plenty of examples and exercises are included often taken or inspired from the scientific literature and covering a broad range of topics such as neuroscience cell biology genetics evolution ecology microbiology physiology epidemiology and conservation The book delivers generic modeling techniques used across a wide range of situations in biology and hence readers from other scientific disciplines will find that much of the material is also applicable in their own field Proofs of most mathematical statements are included for the interested reader but are not essential for a practical understanding of the material The book introduces the popular scientific programming language MATLAB as a tool for simulating models fitting models to data and visualizing data and model predictions The material taught is current as of MATLAB version 2022b The material is taught in a sufficiently general way that also permits the use of alternative programming languages *MATLAB® Recipes for Earth Sciences* Martin H. Stochastic Models for Geodesy and Geoinformation Science Frank Neitzel, 2021-02-12 In geodesy and geoinformation science as well as in many other technical disciplines it is often not possible to directly determine the desired target quantities Therefore the unknown parameters must be linked with the measured values by a mathematical model which consists of the functional and the stochastic models The functional model describes the geometrical physical relationship between the measurements and the unknown parameters This relationship is sufficiently well known for most applications With regard to the stochastic model two problem domains of fundamental importance arise 1 How can stochastic models be set up as realistically as possible for the various geodetic observation methods and sensor systems 2 How can the stochastic information be adequately considered in appropriate least squares adjustment models Further questions include the interpretation of the stochastic properties of the computed target values with regard to precision and reliability and the use of the results for the
