Greenwood, 2007-10-31 *Spectroscopic Properties of Inorganic and Organometallic Compounds* provides a unique source of information on an important area of chemistry. Divided into sections mainly according to the particular spectroscopic technique used, coverage in each volume includes NMR with reference to stereochemistry, dynamic systems, paramagnetic complexes, solid state NMR, and Groups 13-18 nuclear quadrupole resonance spectroscopy, vibrational spectroscopy of main group and transition element compounds, and coordinated ligands and electron diffraction. Reflecting the growing volume of published work in this field, researchers will find this Specialist Periodical Report an invaluable source of information on current methods and applications. Specialist Periodical Reports provide systematic and detailed review coverage in major areas of chemical research. Compiled by teams of leading experts in their specialist fields, this series is designed to help the chemistry community keep current with the latest developments in their field. Each volume in the series is published either annually or biennially and is a superb reference point for researchers. www.rsc.org/spr *Spectroscopic Properties of Inorganic and Organometallic Compounds* Jack Yarwood, Richard Douthwaite, Simon Duckett, 2010-06 *Spectroscopic Properties of Inorganic and Organometallic Compounds: Techniques, Materials and Applications* provides a unique source of information in an important area of chemistry. Since Volume 40, the nature and ethos of this series have been altered to reflect a change of emphasis towards Techniques, Materials and Applications. Researchers will now find up-to-date critical reviews which provide in-depth analyses of the leading papers in the field, with authors commenting on the quality and value of the work in a wider context. Focus areas will include structure-function relationships, photochemistry, and spectroscopy of inorganic complexes and catalysis materials such as ceramics, cements, pigments, glasses, and corrosion products, techniques such as advanced laser spectroscopy, and theoretical methods. *Organometallic Chemistry* E. W. Abel, F. G. A. Stone, 2007-10-31 Organometallic chemistry is an interdisciplinary science which continues to grow at a rapid pace. Although there is continued interest in synthetic and structural studies, the last decade has seen a growing interest in the potential of organometallic chemistry to provide answers to problems in catalysis, synthetic organic chemistry, and also in the development of new materials. This Specialist Periodical Report aims to reflect these current interests, reviewing progress in theoretical organometallic chemistry, main group chemistry, the lanthanides, and all aspects of transition metal chemistry. Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research. Written by experts in their specialist fields, the series creates a unique service for the active research chemist, supplying regular, critical, in-depth accounts of progress in particular areas of chemistry. For over 80 years, the Royal Society of Chemistry and its predecessor, the Chemical Society, have been publishing reports charting developments in chemistry, which originally took the form of Annual Reports. However, by 1967, the whole spectrum of chemistry could no longer be contained within one volume, and the series Specialist Periodical Reports was born. The Annual Reports themselves still existed but were divided into two, and subsequently three volumes covering Inorganic, Organic, and Physical Chemistry. For

more general coverage of the highlights in chemistry they remain a must Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry Some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued The current list of Specialist Periodical Reports can be seen on the inside flap of this volume Local Structural Characterisation Duncan W. Bruce, Dermot O'Hare, Richard I. Walton, 2013-07-31 Inorganic materials are at the heart of many contemporary real world applications in electronic devices drug delivery bio inspired materials and energy storage and transport In order to underpin novel synthesis strategies both to facilitate these applications and to encourage new ones a thorough review of current and emerging techniques for materials characterisation is needed Examining important techniques that allow investigation of the structures of inorganic materials on the local atomic scale Local Structural Characterisation discusses Solid State NMR Spectroscopy X Ray Absorption and Emission Spectroscopy Neutrons and Neutron Spectroscopy EPR Spectroscopy of Inorganic Materials Analysis of Functional Materials by X Ray Photoelectron Spectroscopy This addition to the Inorganic Materials Series provides a detailed and thorough review of these spectroscopic techniques and emphasises the interplay between chemical synthesis and physical characterisation *Organometallics of the f-Elements* Marks, 2013-06-29 While the organometallic chemistry of the d block transition elements has been a flourishing field for the past 25 years it has only been in the last several years that dramatic activity and progress has occurred in the area of lanthanide and actinide organometallic chemistry The f element organometallic research effort has been truly multinational and multidisciplinary In a large number of countries scientists have become increasingly interested in the synthesis reactivity spectroscopy and the molecular and electronic structures of f element organometallic compounds The backgrounds of these scientists range from organic inorganic nuclear and catalytic chemistry to chemical and nuclear physics The motivations for the study of f element organometallics have been equally varied In the area of basic research there has been a growing realization that the lanthanides and actinides represent two unique and to a great extent neglected families of elements in which many fascinating aspects of chemistry and bonding remain to be explored On a more practical level an increasing number of these elements play important roles in nuclear energy production and in industrial catalytic processes It has become apparent that efficiency and safety in both areas could greatly benefit from increased knowledge In the past there has been no suitable international forum available for bringing together researchers in the diverse areas of f element organometallic science mentioned above Journal of the Chemical Society Chemical Society (Great Britain), 1989
