Surface Engineering Shaker A. Meguid,2013-12-20 Integral geometry deals with the problem of determining functions by their integrals over given families of sets These integrals define the corresponding integral transform and one of the main questions in integral geometry asks when this transform is injective On the other hand when we work with complex measures or forms operators appear whose kernels are non trivial but which describe important classes of functions Most of the questions arising here relate in one way or another to the convolution equations Some of the well known publications in this field include the works by J Radon F John J Delsarte L Zalcman C A Berenstein M L Agranovsky and recent monographs by L Hormander and S Helgason Until recently research in this area was carried out mostly using the technique of the Fourier transform and corresponding methods of complex analysis In recent years the present author has worked out an essentially different methodology based on the description of various function spaces in terms of expansions in special functions which has enabled him to establish best possible results in several well known problems
