The Category Of H Modules Over A Spectrum Memoirs Of The American Mathematical Society:

The Category of H -Modules over a Spectrum Jack Palmer Sanders, 1974 The category of H modules over a ring spectrum is introduced We prove that mapping cones can be constructed in the category and that these mapping cones are unique up to equivalence Other H modules are constructed by induction and a limit process We prove that each of the classical Thom spectra MO MSO MU MSU and $M\mathbb{S}p$ is a convergent H module over itself Finally we construct a tower of homology theories and natural transformations from MU **Notices of the American Mathematical Society** American Mathematical Society, 1981 *Monographic Series* Library of Congress, **Library of Congress Catalogs** Library of Congress, 1976 Homological Theory of Representations Henning Krause, 2021-11-18 Modern developments in representation theory rely heavily on homological methods This book for advanced graduate students and researchers introduces these methods from their foundations up and discusses several landmark results that illustrate their power and beauty Categorical foundations include abelian and derived categories with an emphasis on localisation spectra and purity The representation theoretic focus is on module categories of Artin algebras with discussions of the representation theory of finite groups and finite quivers Also covered are Gorenstein and quasi hereditary algebras including Schur algebras which model polynomial representations of general linear groups and the Morita theory of derived categories via tilting objects The final part is devoted to a systematic introduction to the theory of purity for locally finitely presented categories covering pure injectives definable subcategories and Ziegler spectra With its clear detailed exposition of important topics in modern representation theory many of which were unavailable in one volume until now it deserves a place in every representation theorist's library *Catalog of Copyright Entries. B. Laursen, Michael Neumann, 2000 Modern local spectral theory is built on the classical spectral theorem a fundamental result in single operator theory and Hilbert spaces This book provides an in depth introduction to the natural expansion of this fascinating topic of Banach space operator theory whose pioneers include Dunford Bishop Foias and others Assuming only modest prerequisites of its readership it gives complete coverage of the field including the fundamental recent work by Albrecht and Eschmeier which provides the full duality theory for Banach space operators It is highlighted by many characterizations of decomposable operators and of other related important classes of operators as well as an in depth study of their spectral properties including identifications of distinguished parts and results on permanence properties of spectra with respect to several types of similarity Also found is a thorough and quite elementary treatment of the modern single operator duality theory this theory has many applications both to general issues of classification and to such

celebrated problems as the invariant subspace problems A long chapter almost a book in itself is devoted to the use of local spectral theory in the study of spectral properties of multipliers and convolution operators Another one describes its connections to automatic continuity theory Written in a careful and detailed style it contains numerous examples many simplified proofs of classical results and extensive references It concludes with a list of interesting open problems suitable for continued research
