Hafez, 2015-03-31 This book covers classical and modern aerodynamics theories and related numerical methods for senior and first year graduate engineering students including The classical potential incompressible flow theories for low speed aerodynamics of thin airfoils and high and low aspect ratio wings The linearized theories for compressible subsonic and supersonic aerodynamics The nonlinear transonic small disturbance potential flow theory including supercritical wing sections the extended transonic area rule with lift effect transonic lifting line and swept or oblique wings to minimize wave drag Unsteady flow is also briefly discussed Numerical simulations based on relaxation mixed finite difference methods are presented and explained Boundary layer theory for all Mach number regimes and viscous inviscid interaction procedures used in practical aerodynamics calculations There are also four chapters covering special topics including wind turbines and propellers airplane design flow analogies and hypersonic rotational flows A unique feature of the book is its ten self tests and their solutions as well as an appendix on special techniques of functions of complex variables method of characteristics and conservation laws and shock waves The book is the culmination of two courses taught every year by the two authors for the last two decades to seniors and first year graduate students of aerospace engineering at UC Davis

Theory of Lift G. D. McBain, 2012-05-22 Starting from a basic knowledge of mathematics and mechanics gained in standard foundation classes Theory of Lift Introductory Computational Aerodynamics in MATLAB Octave takes the reader conceptually through from the fundamental mechanics of lift to the stage of actually being able to make practical calculations and predictions of the coefficient of lift for realistic wing profile and planform geometries The classical framework and methods of aerodynamics are covered in detail and the reader is shown how they may be used to develop simple yet powerful MATLAB or Octave programs that accurately predict and visualise the dynamics of real wing shapes using lumped vortex panel and vortex lattice methods This book contains all the mathematical development and formulae required in standard incompressible aerodynamics as well as dozens of small but complete

working programs which can be put to use immediately using either the popular MATLAB or free Octave computational modelling packages Key features Synthesizes the classical foundations of aerodynamics with hands on computation emphasizing interactivity and visualization Includes complete source code for all programs all listings having been tested for compatibility with both MATLAB and Octave Companion website www.wiley.com/go/mcbain hosting codes and solutions Theory of Lift Introductory Computational Aerodynamics in MATLAB Octave is an introductory text for graduate and senior undergraduate students on aeronautical and aerospace engineering courses and also forms a valuable reference for engineers and designers
