World Agriculture: Towards 2015/2030 Jelle Bruinsma, 2017-09-25

This report is FAO's latest assessment of the long term outlook for the world's food supplies nutrition and agriculture. It presents the projections and the main messages. The projections cover supply and demand for the major agricultural commodities and sectors including fisheries and forestry. This analysis forms the basis for a more detailed examination of other factors such as nutrition and undernourishment and the implications for international trade. The report also investigates the implications of future supply and demand for the natural resource base and discusses how technology can contribute to more sustainable development. One of the report's main findings is that if no corrective action is taken the target set by the World Food Summit in 1996 that of halving the number of undernourished people by 2015 is not going to be met. Nothing short of a massive effort at improving the overall development performance will free the developing world of its most pressing food insecurity problems. The progress made towards this target depends on many factors not least of which are political will and the mobilization of additional resources. Past experience underlines the crucial role of agriculture in the development process particularly where the majority of the population still depends on this sector for employment and income.

Advanced Renewable Energy Sources G. N. Tiwari, Rajeev Kumar Mishra, 2012. This book is an ideal reference text for teaching renewable energy to engineering and science students as well as a reference book for scientists and professionals doing self study on the subject. The book has twelve chapters and starts with the definition and classification of renewable and non renewable energy and their status at global level. This chapter also contains the basic heat transfer mechanisms and laws of thermodynamics. It then deals with availability of solar radiation at different latitudes and energy and exergy analysis of flat plate collector solar air collector solar concentrator evacuated tube collector solar water heating system solar distillation and solar cooker. The following chapter discusses the basics of semiconductor its characteristics working characteristics of solar cell in dark and daylight situation fundamentals of characteristic curves of semiconductor fundamentals of PV module and array and some PVT systems. Detailed discussion on biomass bio fuels and biogas and their applications and the power produced by them namely bio power is covered in the following chapters. Other renewable energy sources like hydropower wind and geothermal are then covered as well as a chapter dealing with the working principle basic theory and the capability to produce power from ocean thermal tidal wave and animal energy conversion systems.

Subsequently net CO₂ mitigation carbon credit climate change and environmental impacts of all renewable energy resources are all covered followed by a discussion on the techno economic feasibility of any energy sources as the backbone of its success and hence energy and economic analysis. The chapters deal the overall exergy of renewable energy sources by using the thermal and mechanical power and electrical energy as output. SI units are used throughout the book in solving various exercises in each chapter and conversion units of various physical and chemical parameters of metals and non metals are
