Civilian Power Reactor Program U.S. Atomic Energy Commission,1960      Nuclear Science Abstracts ,1976      *Beyond Engineering* Robert Pool,1997-07-17 We have long recognized technology as a driving force behind much historical and cultural change The invention of the printing press initiated the Reformation The development of the compass ushered in the Age of Exploration and the discovery of the New World The cotton gin created the conditions that led to the Civil War Now in *Beyond Engineering* science writer Robert Pool turns the question around to examine how society shapes technology Drawing on such disparate fields as history economics risk analysis management science sociology and psychology Pool illuminates the complex often fascinating interplay between machines and society in a book that will revolutionize how we think about technology We tend to think that reason guides technological development that engineering expertise alone determines the final form an invention takes But if you look closely enough at the history of any invention says Pool you will find that factors unrelated to engineering seem to have an almost equal impact In his wide ranging volume he traces developments in nuclear energy automobiles light bulbs commercial electricity and personal computers to reveal that the ultimate shape of a technology often has as much to do with outside and unforeseen forces For instance Pool explores the reasons why steam powered cars lost out to internal combustion engines He shows that the Stanley Steamer was in many ways superior to the Model T it set a land speed record in 1906 of more than 127 miles per hour it had no transmission and no transmission headaches and it was simpler one Stanley engine had only twenty two moving parts and quieter than a gas engine but the steamers were killed off by factors that had little or nothing to do with their engineering merits including the Stanley twins lack of business acumen and an outbreak of hoof and mouth disease Pool illuminates other aspects of

technology as well. He traces how seemingly minor decisions made early along the path of development can have profound consequences further down the road and perhaps most important he argues that with the increasing complexity of our technological advances from nuclear reactors to genetic engineering the number of things that can go wrong multiplies making it increasingly difficult to engineer risk out of the equation. Citing such catastrophes as Bhopal, Three Mile Island, the Exxon Valdez, the Challenger, and Chernobyl, he argues that it is time to rethink our approach to technology. The days are gone when machines were solely a product of larger than life inventors and hard working engineers. Increasingly, technology will be a joint effort with its design shaped not only by engineers and executives but also by psychologists, political scientists, management theorists, risk specialists, regulators, and courts and the general public. Whether discussing bovine growth hormone, molten salt reactors, or baboon to human transplants, Beyond Engineering is an engaging look at modern technology and an illuminating account of how technology and the modern world shape each other.

A list of pertinent bibliographies, an author index, and a report number index with availability information are also included.

Engineering Compendium on Radiation Shielding International Atomic Energy Agency, 2013-06-29. The need has arisen for a comprehensive handbook for engineers faced with problems of radiation shielding design. Although there are several excellent books on shielding, they either do not give enough consideration to the many practical design problems or are limited to special aspects of the subject. Recognizing the universal need, the International Atomic Energy Agency decided to sponsor the publication of the present Engineering Compendium on Radiation Shielding. At the first editorial discussions, it was agreed that if such a book were to be undertaken, it would be appropriate not only to create a useful design tool for the practising engineer but also to include well referenced basic data for the research worker. Although trying to keep the book down to a reasonable size, the editors have aimed at a complete presentation of the subject, covering and linking both the technology and the science of shielding. Efforts to make terms and definitions consistent throughout have been only partially successful, owing to the continuing development of new ideas. However, inconsistencies that could not be eliminated are identified whenever possible.

There has been a substantial resurgence of interest in nuclear power in the United States over the past few years. One consequence has been a rapid growth in the research budget of DOE's Office of Nuclear Energy (NE). In light of this growth, the Office of Management and Budget included within the FY2006 budget request a study by the National Academy of Sciences to review the NE research programs and recommend priorities among those programs. The programs to

be evaluated were Nuclear Power 2010 NP 2010 Generation IV GEN IV the Nuclear Hydrogen Initiative NHI the Global Nuclear Energy Partnership GNEP Advanced Fuel Cycle Initiative AFCI and the Idaho National Laboratory INL facilities This book presents a description and analysis of each program along with specific findings and recommendations It also provides an assessment of program priorities and oversight Hearings and Reports on Atomic Energy United States.
