Telecommunications Act Of 1996 The Costs Of Managed Competition:

The Telecommunications Act of 1996: The "Costs" of Managed Competition Dale E. Lehman, Dennis Weisman, 2012-12-06

The Telecommunications Act of 1996 envisioned a competitive free for all in the U S telecommunications industry with removal of barriers to entry in local telecommunications markets and the lifting of the artificial restrictions that kept the Regional Bell Operating Companies RBOCs out of the interLATA long distance market After close to 5 years only one RBOC has been granted permission controversially to enter the interLATA market and local competition has yet to provide most consumers with meaningful choices In addition the wave of mergers across the industry has raised the specter of putting the former Bell System back together again Policymakers now openly question whether the Act can deliver what it promised Three principal themes are developed in this book First there has been a coordination failure between Congress and the FCC in translating the principles embodied in the Act into practice The authors provide evidence for this by analyzing stock market reactions to legislative and regulatory actions This coordination failure was largely predictable given the ambiguity in the Act as well as conflicting jurisdictions between the FCC and the states Second the Act calls for wholesale prices to be based on cost Regulators adopted a costing standard TELRIC that provides a means to subsidize competitive entry in local telephone service markets The ready adoption of the TELRIC standard by regulators is shown to be tied to the third theme price cap regulation provides regulators with insurance against the adverse effects of competition in local telephone markets Statistical analysis reveals that regulators in price cap states set uniformly lower unbundled network element prices lower barriers to entry in comparison with regulators in rate of return and earnings sharing states The result is a triumph of regulatory processes over market processes the antithesis of the purpose of the Act

Electricity Pricing in Transition Ahmad Faruqui, Kelly Eakin, 2012-12-06 *Electricity Pricing In Transition* is written to address the new issues facing utilities retailers regulators and customers in the changing electricity market It is organized into five sections Section I deals with the new

restructured organization that has emerged from yesterday's vertically integrated regulated monopoly company. Section II deals with issues in competitive pricing. Section III reviews the role of demand response and product design in today's chaotic marketplace. Given the single importance of California's energy crisis and the fact that it will be studied for years to come, Section IV is devoted to studying the lessons learned from this crisis. The final section of the book deals with markets and regulations. This book will provide practitioners with guidance on how to avoid the major pitfalls in pricing electricity while the market is in transition by drawing upon the insights and lessons learned from the experience of others that are documented in this book.

Forecasting the Internet David G. Loomis, L.D. Taylor, 2012-12-06 David O. Loomis, Illinois State University. The explosive growth of the Internet has caught most industry experts off guard. While data communications was expected to be the wave of the future, few industry observers foresaw how rapid the change in focus from voice communications towards data would be. Understanding the data communications revolution has become an urgent priority for many in the telecommunications industry. Demand analysis and forecasting are critical tools to understanding these trends for both Internet access and Internet backbone service. Businesses have led residential customers in the demand for data services, but residential demand is currently increasing exponentially. Even as business demand for data communications is becoming better understood, residential broadband access demand is still largely unexplored. Cable modems and ADSL appear to be the current residential broadband choices, yet demand elasticities and econometric model-based forecasts for these services are not currently available. The responsiveness of customers to price and income changes and customers' perceptions of the tradeoff in product characteristics between cable modems and ADSL is largely unknown. Demand for Internet access is derived from the demand for applications which utilize this access; access is not demanded independent of its usage. Thus, it is important to understand Internet applications in order to understand the demand for access.
