DC Power System Design for Telecommunications Whitham D. Reeve, 2006-10-25 Straightforward systematic approach for designing reliable dc power systems for telecommunications Here is a must have resource for anyone responsible for designing installing and maintaining telecommunications systems The text explains how to design direct current dc power systems that operate at nominal voltages of 24 and 48 volts dc use lead acid batteries and are installed in public network telecommunications systems and other exclusive use environments Rather than train readers to design systems by rote the author gives readers the skills and knowledge to perform systematic analyses to make the best choices based on several economic operational electrical and physical considerations Written in a straightforward style that avoids unnecessary jargon and complex mathematics the text covers all the essentials of dc power systems for telecommunications Detailed descriptions of the seven major system components Rectifier charger System Battery System Charge Bus Discharge Bus Primary Distribution System Secondary Distribution System and Voltage Conversion System Detailed descriptions include design equations reference tables block diagrams and schematics Design procedures to help readers select the most appropriate power system elements such as buses wiring overcurrent protection rectifiers and batteries Application of the American National Standards Institute s telecommunications industry standards and other relevant standards practices and codes Strategies for dealing with voltage drop in distribution and battery circuits as well as guidance for sizing circuit wiring to meet voltage drop and current rating requirements In depth discussions that focus on the types of lead acid batteries used in telecommunications and their applications Throughout the text examples demonstrate how theory is applied to real world telecommunications systems Some 330 illustrations and more than 100 tables are also provided to help readers visualize and better understand complex systems Design and application examples and accompanying solutions help readers understand the design process and use their new skills In summary engineers and technicians in the telecommunications industry will find all the resources they need to design reliable dc power systems

Satellite

Communication Systems Design S. Tirró, 1993-06-30 Writing a comprehensive book on satellite communications requires the command of many technical disciplines and the availability of up to date information on international recommendations system architectures and equipment standards It is therefore necessary to involve many authors each possessing a good

level of knowledge in a particular discipline The problem of using a coherent and unambiguous set of definitions and basic terms has been solved by including in the book all the background information needed for understanding satellite communication systems without any major reference to other textbooks specializing in particular disciplines The obvious consequence of this approach has been the large size of the book with the advantages however of practically complete independence from other books more systematic discussion of the subject matter and better readability After the required background information emphasis has been placed on the discussion of techniques and system design criteria rather than on specific equipment implementation or description of particular systems The book may be divided in five parts as follows The first five chapters provide most of the required background information Chapter 6 is an introductory outline of satellite communication systems Chapters 7 to 13 deal with the various aspects of technical system design Chapter 14 discusses system economics Chapter 15 provides a brief insight into some foreseeable future developments of satellite communications

Tactical Communications for the Digitized Battlefield Michael J. Ryan, Michael R. Frater, 2002 Traditional tactical communications systems consist of a number of separate subsystems with little interworking between them and with external sensors and weapons systems Combat net radio CNR has provided the high mobility communications required by combat troops while trunk communications systems have provided high capacity communications between headquarters at the expense of mobility The focus of this book is on new information age technologies that promise to offer seamless integration of real time data sharing creating a single logical network architecture to facilitate the movement of data throughout the battlespace Because the structure of this network is constrained by the fundamental trade off between range mobility and capacity that applies to all communications systems this network is unlikely to be based on a single network technology This book presents an architecture for this network and shows how its subsystems can be integrated to form a single logical network
