Successful innovation projects are the result of a complex inter-play of many different actors and activities. A critical – but somewhat neglected – success factor for research and development (R&D) and innovation projects lies in creating the favourable spatial conditions in which employees carry out R&D activities. Research has shown that designing physical environments can encourage processes that play a vital role in product creation, such as knowledge-sharing, learning and collaboration. To shed more light on how R&D workspaces may look like in the near future, the authors have conducted 13 interviews with R&D and innovation managers of leading Swiss and German companies over the course of six months. The results have been transformed into six “R&D workspace scenarios”.

1. Introduction & Motivation

Successful innovation projects are the result of a complex inter-play of many different actors and activities. A critical – but somewhat neglected – success factor for research and development (R&D) and innovation projects lies in creating the favourable spatial conditions in which employees carry out R&D activities. Research has shown that designing physical environments can encourage processes that play a vital role in product creation, such as knowledge-sharing, learning and collaboration. For example, pioneering work done by Tom Allen from MIT, already published in the 1970ies, demonstrated that communication between individuals is of utmost importance to initiate and to develop new ideas. However, only few additional authors have given specific attention to R&D work environments (e.g. Boustellier et al., 2008) or have put an effort into integrating different research streams.

In contrast to other facilities, R&D buildings are usually highly complex and have to fulfil a wide range of functional, technical, economical and legal requirements. All eventualities that may occur over the life span of a building can be hardly predicted for ordinary buildings – let alone for research buildings (Hegger, 2005). When industry created specialised R&D facilities, back in the beginning of the 20th century, they emulated the

university system (Allen and Henn, 2007). In these organisations, departments organised around specialised areas of knowledge. This organisational structure, however, proved to be too simplistic. As products got more complex and embodied more technologies, a variety of disciplines had to be integrated, which required a significant amount of coordination. Specialists had to keep one another informed of what they were doing on a regular basis. Over the course of the last decades, R&D-intensive firms have therefore formed their own ways of organising R&D work.

In the meantime, the authors observe a growing interest from industry to know more about the design of R&D facilities. The motivations for this interest are manifold. Some companies have been able to grow steadily in recent years and simply require bigger R&D buildings. Other organisations have to deal with the growing complexity of their products, forcing them to integrate more external specialists into their R&D projects. Some want to offer the most advanced R&D work environments to attract the most talented scientists and engineers. From an academic perspective, research on the design of R&D work environments is usually limited to case studies of large, multi-national companies (e.g. Boustellier et al., 2008). There are almost no efforts to generalise the findings for a wider range of organisations, especially for mid-sized firms that have limited R&D resources, but
