Telerobotics Automation And Human Supervisory Control:

Telerobotics, Automation, and Human Supervisory Control Thomas B. Sheridan, 1992 For the past three decades the author and his colleagues in the MIT Man Machine Systems Laboratory have been carrying out experimental research in the area of teleoperation telerobotics and supervisory control a new form of technology that allows humans to work through machines in hazardous environments and control complex systems such as aircraft and nuclear power plants This timely reference brings together a variety of theories and technologies that have emerged in a number of fields of application describing common themes presenting experiments and hardware embodiments as examples and discussing the advantages and the drawbacks of this new form of human machine interaction There are many places such as outer space the oceans and nuclear biologically and chemically toxic environments that are inaccessible or hazardous to humans but in which work needs to be done Telerobotics remote supervision by human operators of robotic or semi automatic devices is a way to enter these difficult environments Yet it raises a host of problems such as the retrieval of sensory information for the human operator and how to control the remote devices with sufficient dexterity In its complete coverage of the theoretical and technological aspects of telerobotics and human computer cooperation in the control of complex systems this book moves beyond the simplistic notion of humans versus automation to provide the necessary background for exploring a new and informed cooperative relationship between humans and machines

Human-Robot Interactions in Future Military Operations Florian Jentsch,2016-05-23 Soldier robot teams will be an important component of future battle spaces creating a complex but potentially more survivable and effective combat force The complexity of the battlefield of the future presents its own problems The variety of robotic systems and the almost infinite number of possible military missions create a dilemma for researchers who wish to predict human robot interactions HRI performance in future environments Human Robot Interactions in Future Military Operations provides an opportunity for scientists investigating military issues related to HRI to present their results cohesively within a single volume The issues range from operators interacting with small ground robots and aerial vehicles to supervising large near autonomous vehicles capable of intelligent battlefield behaviors The ability of the human to team with intelligent unmanned systems in such environments is the focus of the volume As such chapters are written by recognized leaders within their disciplines and they discuss their research in the context of a broad based approach Therefore the book allows

researchers from differing disciplines to be brought up to date on both theoretical and methodological issues surrounding human robot interaction in military environments. The overall objective of this volume is to illuminate the challenges and potential solutions for military HRI through discussion of the many approaches that have been utilized in order to converge on a better understanding of this relatively complex concept. It should be noted that many of these issues will generalize to civilian applications as robotic technology matures. An important outcome is the focus on developing general human robot teaming principles and guidelines to help both the human factors design and training community develop a better understanding of this nascent but revolutionary technology. Much of the research within the book is based on the Human Research and Engineering Directorate HRED U S Army Research Laboratory ARL 5 year Army Technology Objective ATO research program. The program addressed HRI and teaming for both aerial and ground robotic assets in conjunction with the U S Army Tank and Automotive Research and Development Center TARDEC and the Aviation and Missile Development Center AMRDEC. The purpose of the program was to understand HRI issues in order to develop and evaluate technologies to improve HRI battlefield performance for Future Combat Systems FCS. The work within this volume goes beyond the research results to encapsulate the ATO's findings and discuss them in a broader context in order to understand both their military and civilian implications. For this reason scientists conducting related research have contributed additional chapters to widen the scope of the original research boundaries.
