Small Gains:

Making It All Work John Schultz, 2010-09-13 This book explains how to organize and manage modifications during the solution realization phase of problem solving so improvements become the new way of life. The nine steps detailed in the book's chapters, although applied to solution implementation, can be used on their own to manage many types of system modification. These transition activities are framed in a three-stage model first proposed by Kurt Lewin, the father of change theory. It packages a strategy for sustaining improvements that is easy to understand and apply: unfreeze, change, and refreeze. Fundamental organizational performance techniques are introduced during each step to assist in managing the transformation from idea to integrated solution. These practices are not new or revolutionary but often overlooked while team members focus on statistical and analytical means. The described methods have a decidedly human focus and are meant to supplement the familiar diagnostic tools associated with six sigma and process improvement projects. **Choice, Decision, and Measurement** A.A.J. Marley, 2019-05-23 This volume is the result of a conference held at the University of California Irvine on the topics that provide its title: choice, decision, and measurement. The conference was planned and the volume prepared in honor of Professor R. Duncan Luce on his 70th birthday. Following a short autobiographical statement by Luce, the volume is organized into four topics to each of which Luce has made significant contributions. The book provides an overview of current issues in each area and presents some of the best recent theoretical and empirical work. Personal reflections on Luce and his work begin each section. These reflections were written by outstanding senior researchers: Peter Fishburn, Preference and Decision Making; Patrick Suppes, Measurement Theory and Axiomatic Systems; William J. McGill, Psychophysics and Reaction Time; and W. K. Estes, Choice Identification and Categorization. The first section presents recent theoretical and empirical work on descriptive models of decision making and theoretical results on general probabilistic models of choice and ranking. Luce's recent theoretical and empirical work on rank and sign dependent utility theory is important in many of these contributions. The second section presents results from psychophysics: probabilistic measurement, aggregation of expert opinion, and test theory. The third section presents various process-oriented models with supportive data for tasks such as redundant signal detection, forced choice, and absolute identification. The final section contains theory and data on categorization and attention and general theoretical results for developing and testing models in these domains. *New Blueprints for Gains in Stocks and Grains & One-Way Formula for Trading in Stocks & Commodities* William Dunnigan, 2005-06-30 Easy to use and adopted by many successful traders over the years, William Dunnigan's *One Way Formula for Trading in Stocks and Commodities* is a robust and reliable mechanical approach to buy/sell decision making in speculative markets. A rare example of a universal formula, this technique can be applied to almost any stock or commodity market and requires little more than accurate line and bar charts. To understand the union of these two books, we have to understand the author's ambition to develop a complete trading system which gave exact buy/sell signals for stocks or

commodities which was mechanical in all its applications and which didn't require the user to make any mental decisions In *New Blueprints for Gains in Stocks and Grains* the author explores and introduces a full range of technical principles and lays the essential analytical groundwork for this universal formula
