Pines,2017-11-22 This paper reviews some of the important technical barriers that must be overcome to achieve truly
efficient flying adaptive micro air vehicles MAVs As defined by the Defense Advanced Research Agency DARPA MAVs are
vehicles with no length dimension greater than 6 inches These vehicles typically weigh less than 100 grams and some can fly
for approximately 30 minutes Over the past decade significant progress has been made in developing these small scale
mechanical flying machines However there is still much work to be done if these vehicles are to approach the efficiency and
performance of biological fliers This paper reviews the status of current miniature mechanical flying machines and compares
their performance with common biological flyers such as birds and small insects This comparison reveals that advances in
aerodynamic efficiency lightweight and adaptive wing structures energy conversion propulsion systems and flight control are
required to match or exceed the performance of nature's great flyers **Future Energy Conferences and Symposia** ,1994
