Despite increasing research to facilitate the understanding of the pathophysiology of autoimmune disorders the exact cause of the incident of autoimmunity is unknown Current concepts on the occurrence of autoimmune diseases are thought to involve autoantigens genetic predisposition disease triggers and the breakdown of immune tolerance In addition to the breakdown of immunological tolerance one key characteristic of autoimmune disease is that within a single disease there is considerable variability in the clinical manifestation and severity in patients Single cell omics have emerged as an effective means of unraveling the complexity and heterogeneity of chronic disease development and therapeutic responses Recently advances in cutting edge spatial profiling of diverse cell types have increased our understanding of how distinct cells interact and orchestrate at specific locations across a tissue landscape in both physiological and pathological contexts at the single cell level
