Spade Spaces And Design:

Multiprocessor Systems on Chip Torsten Kempf, Gerd Ascheid, Rainer Leupers, 2011-02-11 This book gives a comprehensive introduction to the design challenges of MPSoC platforms focusing on early design space exploration. It defines an iterative methodology to increase the abstraction level so that evaluation of design decisions can be performed earlier in the design process. These techniques enable exploration on the system level before undertaking time and cost intensive development.

Integrated System-Level Modeling of Network-on-Chip enabled Multi-Processor Platforms Tim Kogel, Rainer Leupers, Heinrich Meyr, 2006-08-25 We are presently observing a paradigm change in designing complex SoC as it occurs roughly every twelve years due to the exponentially increasing number of transistors on a chip. This design discontinuity as all previous ones is characterized by a move to a higher level of abstraction. This is required to cope with the rapidly increasing design costs. While the present paradigm change shares the move to a higher level of abstraction with all previous ones, there exists also a key difference. For the first time, shrinking geometries do not lead to a corresponding increase of performance. In a recent talk, Lisa Su of IBM pointed out that in 65nm technology only about 25% of performance increase can be attributed to scaling geometries while the lion share is due to innovative processor architecture. We believe that this fact will revolutionize the entire semiconductor industry. What is the reason for the end of the traditional view of Moore's law? It is instructive to look at the major drivers of the semiconductor industry: wireless communications and multimedia. Both areas are characterized by a rapidly increasing demand of computational power in order to process the sophisticated algorithms necessary to optimally utilize the precious resource bandwidth. The computational power cannot be provided by traditional processor architectures and shared bus type of interconnects. The simple reason for this fact is energy efficiency: there exist orders of magnitude between the energy efficiency of an algorithm implemented as a fixed functionality computational element and of a software implementation on a processor.

Mastering Data Mining Techniques Dhaanyalakshmi Ahuja, 2025-01-03 The illustrations in this book are created by Team Educohack. *Mastering Data Mining Techniques* is your comprehensive guide to extracting valuable insights from corporate databases. This book demonstrates how data mining has evolved into an essential tool for modern business with updates and revisions to all chapters plus new additions. We provide clear explanations of complex topics using concise language, minimizing jargon and formulas. Technical subjects are illustrated with real world examples and case studies offering practical tips for marketing analysts, business managers and data mining professionals. We cover linear and logistic regression, clustering methods and an overview of data mining applications, establishing a business context and methodologies common to all projects. Data mining is a crucial step in the KDD process used for conceptual explanations, related analysis, model construction, data clustering and time series trend modeling. We emphasize the importance of measures of interest, detailing their relevance and guiding the data mining process.

The book also explores data warehousing and multidimensional databases as interlayers between data sources allowing integration of online analytical processing and data mining Starting with an overview of data warehousing concepts we propose an integrated OLAM architecture *Eclipse* Martijn Rutten,2007 Consumer multimedia systems such as DVD recorders and digital televisions contain specialized chips that implement a large part of the functionality Traditionally semiconductor vendors develop a custom tailored chip for each new product to optimize cost and performance of the target system However the rapid succession of new products in the market as well as the pace at which new multimedia applications are introduced foreits this approach This thesis addresses this problem by introducing Eclipse a generic chip architecture that targets a whole range of products in a single architectural effort Particular instances of such a more generic platform can then quickly be created and tuned to the product s specific requirements An Eclipse subsystem consists of multiple function specific processors that can be linked to together perform a single function The combination of function specific processors with software configurability gives a high degree of flexibility with the efficiency of dedicated hardware The thesis details all phases of the Eclipse design the patented architecture concepts the design methodology for creating new Eclipse processors a detailed analysis of the architecture based on simulations of an Eclipse system for digital video and three industrial applications of Eclipse
