Spatial Deterministic Epidemics:

   Spatial Deterministic Epidemics Linda Rass,John Radcliffe,2003 Rass and Radcliffe draw together in one volume mathematical theory which until now has existed only in a large number of papers scattered over many journals They use rigorous analytic methods to determine the behavior of spatial deterministic models of certain multi type epidemic processes where infection is spread by means of contact distribution The results obtained include the existence of traveling wave solutions the asymptotic speed of propagation and the spatial final size For researchers and graduate students working in mathematical methods in biology Annotation c 2003 Book News Inc Portland OR booknews com   **Spatial Dynamics and Pattern Formation in Biological Populations** Ranjit Kumar Upadhyay,Satteluri R. Mathematics in Population Biology Horst R. Thieme,2018-06-05 The formulation analysis and re evaluation of mathematical models in population biology has become a valuable source of insight to mathematicians and biologists alike This book presents an overview and selected sample of these results and ideas organized by biological theme rather than mathematical concept with an emphasis on helping the reader develop appropriate modeling skills through use of well chosen and varied examples Part I starts with unstructured single species population models particularly in the framework of continuous time models then adding the most rudimentary stage structure with variable stage duration The theme of stage structure in an age dependent context is developed in Part II covering demographic concepts such as life expectation and variance of life length and their dynamic consequences In Part III the author considers the dynamic interplay of host and parasite populations i e the epidemics and endemics of infectious diseases The theme of stage structure continues here in the analysis of different stages of infection and of age structure that is instrumental in optimizing vaccination strategies Each section concludes with exercises some with solutions and suggestions for further study The level of mathematics is relatively modest a toolbox provides a summary of required results in differential equations integration and integral equations In

addition a selection of Maple worksheets is provided The book provides an authoritative tour through a dazzling ensemble of topics and is both an ideal introduction to the subject and reference for researchers   Large Deviations for Stochastic Processes Jin Feng,Thomas G. Kurtz,2015-02-03 The book is devoted to the results on large deviations for a class of stochastic processes Following an introduction and overview the material is presented in three parts Part 1 gives necessary and sufficient conditions for exponential tightness that are analogous to conditions for tightness in the theory of weak convergence Part 2 focuses on Markov processes in metric spaces For a sequence of such processes convergence of Fleming s logarithmically transformed nonlinear semigroups is shown to imply the large deviation principle in a manner analogous to the use of convergence of linear semigroups in weak convergence Viscosity solution methods provide applicable conditions for the necessary convergence Part 3 discusses methods for verifying the comparison principle for viscosity solutions and applies the general theory to obtain a variety of new and known results on large deviations for Markov processes In examples concerning infinite dimensional state spaces new comparison principles are derived for a class of Hamilton Jacobi equations in Hilbert spaces and in spaces of probability measures   **Mathematical Models in Epidemiology** Fred Brauer,Carlos Castillo-Chavez,Zhilan Feng,2019-10-10 The book is a comprehensive self contained introduction to the mathematical modeling and analysis of disease transmission models It includes i an introduction to the main concepts of compartmental models including models with heterogeneous mixing of individuals and models for vector transmitted diseases ii a detailed analysis of models for important specific diseases including tuberculosis HIV AIDS influenza Ebola virus disease malaria dengue fever and the Zika virus iii an introduction to more advanced mathematical topics including age structure spatial structure and mobility and iv some challenges and opportunities for the future There are exercises of varying degrees of difficulty and projects leading to new research directions For the benefit of public health professionals whose contact with mathematics may not be recent there is an appendix covering the necessary mathematical background There are indications which sections require a strong mathematical background so that the book can be useful for both mathematical modelers and public health professionals   **Mathematics of Public Health** V.
