**Space Supporting Africa** Annette Froehlich,André Siebrits,Christoffel Kotze,2020-12-19 This book addresses the need to support decision makers across Africa by promoting awareness of the importance of space technologies and data to African development through the presentation of existing examples where space supports education and healthcare and by making recommendations for further roll out of these efforts This is necessary because of the enduring misconception that space related research and expenditure competes with other more pressing needs on the continent when in truth space can play a major role in meeting these needs Accordingly the book unpacks the United Nations Sustainable Development Goals SDGs 2030 and the critical needs they address in the African context Secondly it provides an analysis of the African higher education landscape and considers the network of higher education related SDGs their targets and their indicators Africa s own development plan Agenda 2063 is also explored The African higher education landscape is then assessed by way of three models the Space Education Equation SEE the Benefits to Education by Space Transection BEST and the Enhanced Education for Sustainable Development Access and Success EESDAS model The critical role of educational technologies and e learning in bridging the educational access and success gap is appraised as is the role of the space sector and its technologies applications and data in African higher education Finally it explores e health and provides an analysis of pertinent technologies required by e health past and present and the opportunities and challenges it presents Space technology can play a critical role in eliminating the barriers that are currently preventing e health from playing a more significant role in a developing region such as sub Saharan Africa

Farid Gamgami,2025-02-10 The objective of this textbook is to provide a synopsis of propulsion technologies in the context of

spaceship design The author identified a lack of multidisciplinary textbooks that explain to students both the technology and physics of space propulsion as well as its relationship to other disciplines in the process of spaceship design To make the subject more tangible the propulsion demanding context of space exploration was chosen The book therefore begins with the astronomical context relevant to human exploration of the solar system This challenging endeavour requires powerful space propulsion systems of various types Existing and emerging technologies are systematically discussed Principle similarities and technological analogies between the different types are highlighted Starting from the physical working principle the book progressively extends the view to subsystem and system design aspects This approach recognises that the propulsion subsystem is the most defining architectural element of large spacecraft i e starships Such a comprehensive presentation of propulsion technology from a system perspective is not yet reflected in the existing literature In order to apply the fundamental knowledge provided in the first 9 chapters a mission to the dwarf planet Ceres is presented where different propulsion technologies have to be combined to achieve the mission objectives In this way the reader is introduced to the basics of requirements breakdown design space analysis and the technical trade off process all of which are essential for early mission planning The book is aimed at advanced undergraduate and graduate students recent postgraduates and newcomers to the field of spacecraft design where propulsion is essential
