Designing for Humans Jan Noyes, 2002-09-26 Nature aside the world in which we live should be designed for us from everyday products like scissors and chairs to complex systems in avionics medicine and nuclear power applications Now more than ever technological advances continue to increase the range and complexity of tasks that people have to perform As a discipline human factors psychology ergonomics therefore has an increasingly important role to play in ensuring that the human user's physical characteristics cognitive abilities and social needs are taken into account in the development implementation and operation of products and systems In this book Jan Noyes provides a comprehensive and up to date overview of human machine interaction and the design of environments at work Focusing on topics relevant to user centred design she includes coverage of the capabilities and limitations of humans human machine interactions work environments and organizational issues Health and safety issues underpin a large amount of work on the human factors of design and these are addressed fully throughout the book Each chapter includes case studies that demonstrate the real world relevance of the points being made and concludes with a list of key points Although aimed primarily at advanced undergraduates postgraduates and researchers in organizational and occupational psychology this book will also be of relevance to students on engineering computing and applied psychology human factors programmes

**Integrated System-Level Modeling of Network-on-Chip enabled Multi-Processor Platforms** Tim Kogel, Rainer Leupers, Heinrich Meyr, 2006-08-25 We are presently observing a paradigm change in designing complex SoC as it occurs roughly every twelve years due to the exponentially increasing number of transistors on a chip This design discontinuity as all previous ones is characterized by a move to a higher level of abstraction This is required to cope with the rapidly increasing design costs While the present paradigm change shares the move to a higher level of abstraction with all previous ones there exists also a key difference For the first time shrinking geometries do not lead to a corresponding increase of performance In a recent talk Lisa Su of IBM pointed out that in 65nm technology only about 25% of performance increase can be attributed to scaling geometries while the lion share is due to innovative processor architecture 1 We believe that this fact will revolutionize the entire semiconductor industry What is the reason for the end of the traditional view of Moore's law It is instructive to look at the major drivers of the semiconductor industry wireless communications and multimedia Both areas are characterized by a rapidly increasing demand of computational power in order to process the sophisticated algorithms necessary to optimally utilize the precious resource bandwidth The computational power cannot be provided by traditional processor architectures and shared bus type of interconnects The simple reason for this fact is energy efficiency there exist orders of magnitude between the energy efficiency of an algorithm implemented as a fixed functionality computational element and of a software implementation on a processor
